**National Assessment Program – Literacy
and Numeracy (NAPLAN) 2016 Central
Analysis of Data project staff**

The NAPLAN 2016 Central Analysis of Data project was jointly directed by Associate Professor Stephen M. Humphry of the University of Western Australia (UWA) and Dr Michael J. Young of Pearson in conjunction with Dr Goran Lazendic, Dr Rassoul Sadeghi, Dr Lihong Yang, Mrs. Jasmine Cohen, and Mr. Ben Businovski of ACARA.

The technical report text and data analysis tasks were undertaken by Associate Professor Stephen M. Humphry and Dr Ida Marais from UWA; Dr Michael J. Young, Dr Daeryong Seo of Pearson, and Dr Mark G. Robeck of Pearson.

CHAPTER 1. INTRODUCTION AND OVERVIEW

Best practice for educational assessment programs dictates public reporting of results and the statistical and psychometric analyses that led to these results. Commonly, these analyses are summarised in an annual Technical Report. A well-documented technical report provides the transparency that measurement professionals, educators, and the general public expect and builds confidence that the results of such assessments are reliable, valid, and fair. To satisfy this important expectation, the Australian Curriculum, Assessment and Reporting Authority (ACARA) has commissioned this technical report for National Assessment Program – Literacy and Numeracy (NAPLAN) 2016.

Pearson and the University of Western Australia (UWA), ACARA's primary psychometric contractors for NAPLAN, were appointed to undertake the central analyses of data for the 2016 administration. The tests were administered nationally to all students in Years 3, 5, 7 and 9 in May 2016. Students in each year level were assessed using the same test items presented across five domains: reading, writing, spelling, grammar and punctuation and numeracy. The language conventions test includes the spelling domain and the grammar and punctuation domain.

NAPLAN results are reported using five national achievement scales, one for each of the assessed aspects of literacy – reading, writing, spelling and grammar and punctuation – and one for numeracy. Each NAPLAN achievement scale spans Years 3, 5, 7 and 9 with scores that range from approximately 0 to 1000. There are also ten proficiency bands that span Years 3, 5, 7 and 9. Each year level is reported against six of these bands.

As in previous years, the central analyses were carried out in two stages. The first stage involved item and test analyses and the construction of reporting scales and score-equivalence tables for the 2016 tests. The vertical reporting scales in the five domains were equated onto the historic NAPLAN reporting scales to ensure that results were comparable from 2008 to 2016. The equating was achieved using data collected by administering the secure equating tests and the 2016 tests to a sample of Australian students. The equating forms for each domain and year level had already been scaled onto the historical NAPLAN scale in 2009. The equated reporting scale information with score-equivalence tables for the tests and cut points for proficiency bands provided the necessary information for the jurisdictions to report back to parents and schools.

The second stage involved analyses of the full cohort data that informed national reporting. The analyses provided performance results for the preparation of the NAPLAN 2016 summary information, the NAPLAN 2016 National Report, and for other reporting.

Over one million students in Years 3, 5, 7 and 9 in all states and territories of Australia participated in 2016 NAPLAN. Test data based on student responses were delivered to the Pearson/UWA analysis team from the jurisdictional Test Administration Authorities. There were eight sources of data from the national testing corresponding to the eight states and territories of Australia.

The main aim of this report is to describe and document the methodology used to produce the NAPLAN 2016 assessment scales and the methodology used to report on the performance of the 2016 student cohort. It includes descriptions of test calibration, equating and scale construction processes, and outlines the steps in the analysis. The 2016 test design is

described in Chapter 2. This chapter describes each test in terms of the number and type of items used for each domain and strand level. Chapter 3 summarizes the methodology used in sampling for equating and calibration and presents the participation rates. Chapter 4 is the analysis procedure and methodology chapter, which describes the scaling and equating procedures. Chapter 5 describes the data preparation process, test calibration outcomes and differential item functioning (DIF) analysis outcomes. Test reliabilities, average item discrimination and illustrative tables and figures showing item location, fit and DIF are included in this chapter. Chapter 6 describes the NAPLAN vertical, horizontal and pair-wise equating processes. Graphs showing the equating process, including link reviews, and the shift factors are included in that chapter. Translation constants and equating error calculations are also presented. Finally, Chapter 7 describes the generation of student proficiency estimates, scale transformation procedures and the methodology used for reporting NAPLAN student performance in 2016. Many of these procedures are similar, if not identical, to those used in the Programme for International Student Assessment (PISA). The first appendix is an equating and calibration sampling report from a sub-contractor. The remaining appendices contain classical item analyses, Rasch-based item analyses, item characteristic curves, variable maps and DIF analysis graphs.

This report does not include student performance results. These results are included in the 2016 NAPLAN National Report and can be found at <http://www.nap.edu.au/results-and-reports/national-reports.html>.

ACARA is pleased to present this technical report to all interested organisations and individuals. We anticipate expanding the analyses presented herein as part of our ongoing review of all practices. We invite users of this document to provide feedback on its value and welcome any suggestions to improve both this document specifically and NAPLAN procedures in general.

CHAPTER 2. NAPLAN TEST DESIGN

Four tests were administered at each of Years 3, 5, 7 and 9. The four tests were reading, writing, language conventions (spelling and grammar and punctuation) and numeracy. The test results were reported in five domains: reading, writing, spelling, grammar and punctuation and numeracy.

In reading, language conventions and numeracy, there was a mix of multiple-choice items and constructed-response items. The multiple-choice (MC) items were presented in a standard format with a number of possible answers (usually four) from which students were required to select the best answer. The constructed-response (CR) items generally required a numeric answer, a word or a short phrase. All MC and CR items were dichotomously scored (correct or incorrect).

Each of the Year 7 and Year 9 numeracy tests consisted of two forms. The use of calculators was permitted in the first form (calculator form) but not in the second form (non-calculator form). For Years 7 and 9, both the calculator form and the non-calculator form consisted of 32 items, resulting in a total of 64 items across the two forms for each year level. Year 3 and Year 5 numeracy tests were non-calculator forms that consisted of 35 and 40 items, respectively.

Tables 2.1 to Table 2.4 provide information on the structure of each of the numeracy, reading, spelling and grammar and punctuation test domains in Years 3, 5, 7 and 9.

Table 2.1. Structure of Year 3 Test Domains, NAPLAN 2016

Domain	Strand	Number of MC Items	Number of CR Items	Total for Strand	Total in Test
Numeracy	Statistics and Probability	4	1	5	35
	Measurement and Geometry	10	1	11	
	Number	14	2	16	
	Algebra, Function and Pattern	2	1	3

	Identifies an Error and Correctly Spells	0	15	15	
Grammar & Punctuation	Grammar	19	0	19	28
	Punctuation	9	0	9	

For writing, all students were required to write a narrative text, students from Years 3 and 5 responding to one writing prompt, while students in Years 7 and 9 responded to a different prompt. The scripts were rated based on the same ten criteria (Criteria 1 to 10) across all four year levels. Each of these ten criteria was rated polytomously. The ratings on the ten criteria were treated as data on ten different items each with their own score category. The ten criteria with the associated number of score categories are listed in Table 2.5.

Table 2.5. Criteria and Score Categories for Writing, Years 3 to 9, NAPLAN 2016

Item	Criterion	Score Categories
1	Audience	0-6
2	Text Structure	0-4
3	Ideas	0-5
4	Character and Setting	0-4
5	Vocabulary	0-5
6	Cohesion	0-4
7	Paragraphing	0-2
8	Sentence Structure	0-6
9	Punctuation	0-5
10	Spelling	0-6
Score Range		0-47

CHAPTER 3. SAMPLING DESIGN FOR STAGE-1 ANALYSES

3.1 Overview

As with earlier NAPLAN administrations, sample databases were drawn from states and territories for the purpose of test calibrations and scaling, for equating and for generating preliminary estimates of key national outcomes to be used on parent reports. This approach enabled results to be delivered to jurisdictions in time for reporting to schools and parents. It also provided jurisdictions with preliminary estimates of the final national outcomes some time before the full census data were made available.

There were three sampling activities associated with the NAPLAN 2016:

- The National Calibration Sample – This was a sample of students who participated in the NAPLAN assessments that was used for generating estimates of the key national outcomes to be used on parent reports and for placing the 2016 NAPLAN results on the existing NAPLAN scale. It should be noted that plausible values (PVs) for the 2016 NAPLAN administration were obtained using a new procedure that combined MDLR analyses of stratified random samples from the census data together with analyses of the complete census data. Detailed sampling and MDLR procedures can be found in Chapter 4.
- The Item Calibration Sample – This was a sub-sample of the National Calibration Sample that was used for test calibrations and scaling.
- The Equating Sample – This sample was required to equate the 2016 tests onto the established NAPLAN reporting scales. As in earlier administrations, a common-person equating method was used. Secure equating forms, which had been previously equated onto the NAPLAN reporting scale, were administered to a sample of students in addition to the NAPLAN 2016 tests.

As a contractor for the Australian Curriculum, Assessment and Reporting Authority (ACARA), Educational Measurement Solutions (EMS) worked with documentation from the previous technical vendor (Australian Council for Educational Research (ACER)) and information from ACARA to create the sampling procedures used for the 2016 NAPLAN administration. Documentation for calculating the sampling weights can be found in an ACER report included in Appendix G of the 2012 NAPLAN Technical Report. This appendix provides:

- A description of the source data files that are used to create the sampling weights.
- The steps used for preparing the data.
- The calculation procedure for the sampling weights including adjustments for post-stratification and student-non-response.
- The procedure for checking and assigning weights to the National Calibration Sample file.
- The procedure for calculating the response rates.

Appendix A provides the 2016 NAPLAN EMS report and describes:

- The development of the sample frames for the National Calibration and Equating Samples including the steps used in data preparation and the creation of primary and secondary samples based on grade levels.
- The details of the explicit and implicit stratification used and the selection of schools.
- The procedures employed for using replacement schools when the schools originally selected for the sample did not participate.

The appendix also provides details on the sample frame and sampling parameters used in the 2016 NAPLAN administration.

The remainder of this chapter presents tables describing salient aspects of the National Calibration Sample and the Equating Sample as they were realised during the 2016 administration. These tables include the numbers of schools and students sampled, the assessment participation rates and the distributions of gender, language background (LBOTE), Indigenous status and geolocation by year level.

3.2 The National Calibration Sample

Table 3.1 lists the numbers of schools and students included in the National Calibration Sample from each of the eight jurisdictions. The table shows both the numbers of students (N) who were selected in the sample, as well as the numbers of students (Wtd. N) represented by the samples after sampling weights had been applied to approximate the full population of students who had taken the 2016 NAPLAN tests.

Table 3.1. Numbers of Schools and Students included in the National Calibration Sample by State/Territory and Year Level (2016)

Year Level	Source	NSW	VIC	QLD	WA	SA	TAS	ACT	NT	Total
Year 3	Schools	46	44	47	43	44	30	20	23	297
	Students (N)	2166	1764	2344	1873	1545	1022	1035	713	12462
	Students (Wtd N)	100627	78353	72807	35987	21595	6858	5676	3896	325800
Year 5	Schools	48	46	47	43	43	29	20	24	300
	Students (N)	1901	1726	2244	1731	1513	891	954	671	11631
	Students (Wtd N)	92040	73007	70081	32591	19875	6194	5141	3602	302531
Year 7	Schools	47	44	48	45	42	29	17	16	288
	Students (N)	5353	5463	5910	5254	1598	2268	2508	850	29204
	Students (Wtd N)	90111	70930	64757	31046	19792	6563	5172	4005	292377
Year 9	Schools	47	44	47	44	44	29	16	16	287
	Students (N)	5242	5030	4168	5202	4351	2274	2273	829	29369
	Students (Wtd N)	93977	75297	48524	31516	21970	7079	5527	3978	287868
Total	Schools	94	94	95	88	87	58	70	43	629
	Students (N)	14662	13983	14666	14060	9007	6455	6770	3063	82666
	Students (Wtd N)	376755	297588	256169	131140	83231	26694	21516	15481	1208576

The remainder of this section presents summary tables showing school and student participation in the sample and the distribution of the National Calibration Sample across key population subgroups.

Table 3.2 shows the percentages of schools from the original sampling list (i.e., without replacement schools) that were included in the National Calibration Sample for each jurisdiction by year level, and the inclusion rates when replacement schools were taken into account.

For each jurisdiction and year level, the school response rates before the use of replacement schools are calculated as

$$RRs = P_s / (P_s + NP) \quad (3.1)$$

where RRs is the response rate using sampled schools only, P_s is the number of sampled schools that participated and NP is the number of sampled schools that did not participate.

The school response rate after the use of replacement school is given by

$$RRsr = P_{sr} / (P_{sr} + NP) \quad (3.2)$$

where $RRsr$ is the response rate using sampled schools and replacement schools, P_{sr} is the number of sampled or replacement schools that participated, and NP is the number of sampled schools that did not participate.

Table 3.2. Percentage of Sampled Schools included in the National Calibration Sample (2016)

Year Level	School Type	NSW	VIC	QLD	WA	SA	TAS	ACT	NT
Year 3	Sampled Schools	100	100	100	100	100	100	100	100
	Sampled and Replaced Schools	100	100	100	100	100	100	100	100
Year 5	Sampled Schools	100	100	100	100	100	100	100	100
	Sampled and Replaced Schools	100	100	100	100	100	100	100	100
Year 7	Sampled Schools	100	100	100	100	100	100	100	94
	Sampled and Replaced Schools	100	100	100	100	100	100	100	100
Year 9	Sampled Schools	98	100	100	100	96	100	100	79
	Sampled and Replaced Schools	98	100	100	100	98	100	100	100

Table 3.3 to Table 3.6 present the overall student participation rates obtained by aggregating students across all of the schools within the National Calibration Sample. These participation rates are reported by state/territory and by domain for each year level. Besides students who were *present* for testing, several other categories are shown and defined as follows:

- *Absent* students are students who did not take the test because they were not present when the test was administered, and are identified as absent by the school for the purpose of the test session (ACARA, 2013a, p. 11);
- Students may be labelled *exempt* from one or more of the tests on the basis of English language proficiency or significant disabilities as attested by parents/carers (ACARA, 2013a, p. 10);
- Students may be *withdrawn* from the testing program by their parent/carer for such reasons as religious beliefs or philosophical objections to testing (ACARA, 2013a, p. 12);
- The *other* category includes sanctioned abandonment of the test due to injury and illness and verified by the Test Administration Authority (TAA).

Table 3.3. Year 3 Sample: Overall Participation Category Rates (%) by State/Territory by Domain (2016)

Notes: The percentages of students represented in the table above have been rounded and may not sum to 100.

Table 3.7 to Table 3.10 shows the overall distributions of the National Calibration Sample by several student-level and school-level demographic variables by year level and jurisdiction. The definitions of these variables for Tables 3.7 to 3.9 are taken from the *National Assessment Program – Literacy and Numeracy Achievement in Reading, Persuasive Writing, Language Conventions and Numeracy: National Report for 2013* (ACARA, 2013b):

- *Gender* is the distinction ‘male’ and ‘female’ as reported on a student’s enrolment record (Table 3.7).
- A student is classified as *language background other than English* (LBOTE) if either the student or parents/ guardians speak a language other than English at home (Table 3.8).
- A student is considered to be *Indigenous* if he or she identifies as being of Aboriginal and/or Torres Strait Islander origin. The term ‘origin’ is considered to relate to a person’s Australian Aboriginal or Torres Strait Islander descent and for some, but not all, their cultural identity (Table 3.9).

Prior to 2016, the *geolocation* of a school was described using the MCEECDYA Schools Geographic Location Classification System. In 2016, geolocation was changed to follow the Australian Bureau of Statistics’ *Australian Statistical Geography Standard (ASGS) Remoteness Structure* which uses the categories Major Cities of Australia, Inner Regional Australia, Outer Regional Australia, Remote Australia, and Very Remote Australia (Table 3.10).

Table 3.7. Calibration Sample: Distribution (%) by Gender by Year Level (2016)

Year Level	Gender	NSW	VIC	QLD	WA	SA	TAS	ACT	NT	AUS
Year 3	Male	49.0	50.7	53.8	50.9	51.3	51.4	52.0	51.2	51.3
	Female	51.0	49.3	46.2	49.1	48.7	48.6	48.0	48.8	48.7
Year 5	Male	49.2	51.4	53.8	50.6	50.1	49.3	53.9	52.2	51.3
	Female	50.8	48.6	46.2	49.4	49.9	50.7	46.1	47.8	48.7
Year 7	Male	56.8	49.8	49.1	51.7	46.4	52.2	46.5	50.4	51.0
	Female	43.2	50.2	50.9	48.3	53.6	47.8	53.5	49.6	49.0
Year 9	Male	55.5	54.4	51.0	49.1	52.0	49.8	47.4	51.3	51.8
	Female	44.5	45.6	49.0	50.9	48.0	50.2	52.6	48.7	48.2

Notes: The percentages represented in the table above have been rounded and may not sum to 100.

Table 3.8. Calibration Sample: Distribution (%) by Language Background by Year Level (2016)

Year Level	Language Background	NSW	VIC	QLD	WA	SA	TAS	ACT	NT	AUS

CHAPTER 4. ANALYSIS PROCEDURES AND METHODOLOGY

This chapter describes the processes and methodologies used in the central analysis. The psychometrics and scaling methods used are methods that have been widely utilised in many large scale assessment programs, including the *Programme for International Student Assessment* (PISA).

The NAPLAN 2016 test calibrations were based on the Item Calibration Sample. The equating to the NAPLAN scale was based on the Equating Sample. The NAPLAN program uses multidimensional latent regression (MDLR) to produce the plausible values (PVs) required for the analysis and reporting of NAPLAN results at the national and jurisdictional level. The PVs are estimated using the *ACER ConQuest* Rasch modelling software. In previous NAPLAN administrations, these calibration analyses for national reporting made use of complete census data. However, due to the extensive computer time required to complete these calibrations and the tighter timeline for the release of the results, estimating PVs for the 2016 administration was achieved using a new procedure that combined analyses of stratified random samples from the census data together with analyses of the complete census data. Detailed steps to obtain the PVs can be found in section 4.6, *Stratified Random Sampling and Multidimensional Linear Regression*.

4.1 Data Collection and Data Delivery

Data collection was undertaken by the Test Administration Authorities (TAAs) in the jurisdictions. There were three rounds of data delivery. The first round involved delivery of data from the equating samples and the second round involved the delivery of the calibration samples, both described in Chapter 3. The third round involved delivery of nearly complete full cohort NAPLAN test data of Years 3, 5, 7 and 9 students in July 2016. These data were used for the generation of the NAPLAN 2016 national summary information. The complete set of full cohort data used in the production of the national report was delivered in December 2016. With each round of data delivery, the datasets were cleaned and recoded in preparation for analysis. A systematic process involving data checking was used to ensure that each dataset was consistent with national codeframes and data dictionaries.

4.2 Scaling Model

Test calibration and scaling was performed based on the Rasch model, as was the case in previous administrations.

For multiple-choice items and constructed-response items with a category scored 1 for correct responses and 0 for incorrect responses, the Rasch model predicts the probability of a correct response given the latent trait (θ_n) and the item difficulty or location (δ_i). This is modelled as

$$P_i(1|\theta) = \frac{\exp(\theta_n - \delta_i)}{1 + \exp(\theta_n - \delta_i)} \quad (4.1)$$

where $P_i(1|\theta)$ is the probability of person n to score 1 on item i , θ_n is the estimated latent trait of person n , and δ_i the estimated location of item i on this dimension. For each item, responses are modelled as a function of the latent trait θ_n .

In the case of the writing criteria that are scored using more than two categories, this model can be generalised to the so-called Partial Credit model as

$$P_i(x|\theta) = \frac{\exp \sum_{j=0}^x (\theta_n - \delta_i + \tau_{ij})}{\sum_{h=0}^{m_i} \exp \sum_{j=0}^h (\theta_n - \delta_i + \tau_{ij})} \quad x = 0, 1, \dots, m_i \quad (4.2)$$

where $P_i(x|\theta)$ is the probability of person n to score x on item i , θ_n denotes the person's latent trait, the item parameter δ_i gives the location of the item on the latent continuum, and τ_{ij} is a threshold parameter.

It should be noted that both item (difficulty) and person (ability) parameters are measured on the same scale: in the case of dichotomous items (θ_n) with just two categories (correct and incorrect), for students who have the same ability as the estimated difficulty parameter of an item (δ_i), the probability of giving a correct response is 0.5.

Software used for analyses

For data checking and data analysis the statistical software packages SPSS, SAS and R were used. For the Rasch scaling analysis, the software *ACER ConQuest* (Wu, Adams, Wilson, and Haldane, 2007) was used. *ACER ConQuest* provides tools for the estimation of a variety of item response models and regression models. It was used for test calibrations, for generating weighted likelihood estimates (WLE) for the score-equivalence tables and for drawing plausible values based on a multidimensional item response model with latent regression. In addition, *RUMM2030's* (Andrich, Sheridan and Luo, 2011) person and item estimates, obtained through independent data recoding and calibration, were compared with the results from *ACER ConQuest* to confirm the accuracy of the calibration results.

4.3 Stage One Analyses Based on Item Calibration Sample and Equating Samples

Sequence of analyses

Analyses were undertaken in the following order:

- Item and test analyses based on item calibration sample data (treating 'not reached' items as 'not administered' to obtain appropriate estimates of item difficulty). No weights were used.
- A check of item characteristics using classical statistics such as item facilities (p -values) and distractor analysis, a check of test characteristics using descriptive statistics and frequency distributions, and differential item functioning (DIF) analysis.
- Horizontal equating using the equating data.

- Vertical equating based on common items in tests of adjacent year levels (Year 3 and Year 5, Year 5 and Year 7, Year 7 and Year 9).
- The combination of results from the horizontal and vertical equating to construct the NAPLAN 2016 domain scales.
- The generation of student weighted likelihood estimates (WLE) to obtain score equivalence tables.
- The transformation of logit scores into NAPLAN reporting scale scores.
- The analysis to obtain preliminary results based on the calibration sample data (i.e., the full set data from which the item calibration sample was a sub-sample). Student weights were used in the calculations of preliminary statistics.
- The calculation of standard errors for student summary statistics that took into account sampling, measurement, and equating errors.

Item coding

The recoding of test data was done prior to data analysis.

Data for multiple-choice items were indicated by the letter of the chosen response option for each item, i.e., A, B, C, D, or E. Responses for students not participating on a particular test were recoded to 7s and treated as missing. Multiple responses (8s) were treated as incorrect. Embedded missing responses were coded as 9 by the TAAs and treated as incorrect. Trailing missing responses were also coded as 9 for the first unanswered item and treated as incorrect, while the remaining trailing missing items were recoded as Ms and treated as “not reached”. These not-reached items were treated as missing values for item calibration to obtain an appropriate estimate of the item difficulty (for students who had a chance to respond). However, these omits were treated as incorrect for the final estimation of student abilities.

Data for partial-credit items were indicated by ordered categories starting with 0 up to the maximum possible value. Short-answer items were given scores of 0 or 1. The rules for data recoding are provided in Table 5.1 in the next chapter.

Item calibration

The outcomes of the Rasch analyses, including item and test characteristics, are provided in Chapter 5 and Appendices C and D. The goodness of fit for individual items was based on the Mean Square Statistics. The statistical information regarding item characteristics provided includes:

- Item facility, expressed as percentage correct for each relevant year level.
- Item location on individual year level scales.
- Test targeting and item spread.
- Information about the fit of the item to the Rasch model specified.
- Plots for assessing potential differential item functioning (DIF).
- Information on the consistency of the functioning of link items between adjacent year levels.

Review of test and item characteristics

ACER ConQuest provides statistics for each individual item in tabular form with statistics for response categories. The information provided includes the number of students taking the test item, item discrimination (which is equivalent to the correlation between the correct item category and the corrected total score), the item difficulty parameter and the weighted mean

square (Infit) fit statistic. Other information provided in the tables includes scoring for each category (responses and other codes, such as missing or not reached), the number and percentage of students in each category, the point biserials for each category (correlation with the corrected total score) and their t -values, as well as the average ability estimates of students in each category and their standard deviation. These statistics were used for item review in conjunction with the item characteristic curves (ICC), which show the modelled and empirical curves and distractor behaviours for multiple-choice items. Distractor curves were studied for problem items. This process is described in greater detail in Chapter 5.

In the calibration for each test, the item difficulties and the distribution of student abilities were presented on the same scale. These can be examined visually in the item variable maps provided by *ACER ConQuest*. The reliabilities of the NAPLAN 2016 tests are reported in Chapter 5.

Differential Item Functioning Analysis

Differential item functioning (DIF) occurs when an item is substantially harder for one group than for another group after the overall differences in knowledge of the subject tested are taken into account.

A general problem of DIF analysis is to determine the point below which differences are not significant. With large sample sizes, most of the differences will appear to be statistically significant but may not be of practical importance or substantial in size. Under such circumstance, rules of thumb were used to determine whether there was substantial DIF present for a particular subgroup.

DIF in the test items was examined for gender, LBOTE and Indigenous groupings. With five domains and four year levels for each of the three subgroup pairs (for writing, four year levels were analysed together), a decision was made to first examine DIF in the subgroups using scatter plots of adjusted item parameters. Separate Rasch calibrations were performed over the same set of items for the subgroups. The mean item difficulty in each of the two independent sets of item parameters was centred at zero. One set of item parameters was then plotted against the other set of item parameters. Each item is represented by one point on the plot. A diagonal line was plotted as the reference line. If the relative item difficulty for an item is the same in the two groups after taking their relative performance on the test into account, the point representing the item will be on the diagonal. The further the distance that point is from the diagonal, the larger will be the size of the DIF.

DIF was also examined using *ACER ConQuest* by analysing the data based on a multi-facet model by adding an item-by-subgroup term.

In addition to the DIF analysis of student subgroups, item differential functioning across jurisdictions was also examined. The results are shown in section 5.6.

Vertical reporting scales

A vertical reporting scale was constructed for each of the five domains spanning Years 3, 5, 7 and 9. Each of the scales was equated onto the NAPLAN scales. The scales were used by jurisdictions to report to parents and schools and for national reporting of student performance on the NAPLAN tests.

Reading, Spelling, Grammar and Punctuation, and Numeracy

Each of the reading, spelling, grammar and punctuation, and numeracy vertical scales across Years 3, 5, 7 and 9 was constructed and equated to the NAPLAN vertical scale established in 2008. The equating was performed through: horizontal test equating based on the equating sample data; and vertical equating using linking items embedded in the 2016 tests of adjacent year levels (Year 3 and Year 5, Year 5 and Year 7, Year 7 and Year 9), based on the calibration sample data. Specifically, the transformation needed for each domain score was calculated based on the equating constants determined from the horizontal and vertical equating in combination. The methodology and results of the equating are described in Chapter 6, and scale transformations are described in Chapter 7.

Writing

In 2016, students in Years 3 and 5 responded to one narrative prompt for the writing assessment, while students in Years 7 and 9 responded to another. The resulting scripts were rated using ten criteria. The data from all four year levels were analysed concurrently to construct the vertical writing scale. The writing analysis was based on the Partial Credit model, a polytomous extension of the Rasch model. A new combined writing scale was developed by equating the 2016 narrative writing to the 2011 persuasive writing scale using common item traits across the narrative and persuasive writing rubrics. The details of this method and the results of the equating are discussed in Chapter 6.

Scoring

The raw scores for each student on the five domains were calculated. Omitted responses were scored as being incorrect. Score-equivalence tables based on WLEs in logits were generated for each test in each domain based on delta-centred item parameters. Transformations were applied to the logit scores for conversion to NAPLAN reporting scale scores on the established NAPLAN scales.

The jurisdictions were provided with the transformed score-equivalence tables for rapid generation of student and school reports. The score-equivalence tables provided the means for Test Administration Authorities to locate individual students on year level specific reports using the raw scores for each test.

For the estimation of population statistics, rather than using the WLE estimates, five sets of plausible values of student latent proficiency estimates were drawn using *ACER ConQuest* based on imputation techniques and a multidimensional item response model with latent regression for students in each of the year levels for each of reading, spelling, grammar and punctuation and numeracy. The conditioning variables used were gender, LBOTE status, Indigenous status, school sector, geolocation, parents' education and occupation and school WLE reading mean. For the calibration sample, jurisdiction was also included as a conditioning variable. The plausible values for writing were drawn for Years 3, 5, 7 and 9 concurrently, conditioning on year level, and the school WLE writing mean was used in the conditioning instead of the reading mean. For each student, the school mean was calculated excluding that particular student. The conditioning on background variables increases the precision of population estimates and allows the analysis of relationships between proficiency estimates and background variables. Plausible values were drawn for all students (including absent students and withdrawn students) except for students who were exempt from NAPLAN testing.

National NAPLAN Reporting Scales and Proficiency Bands

A linear transformation was applied to the logit scores in each domain. The transformation for each domain score was based on standardisation procedures established in 2008 and the equating constants and scale factors estimated from the horizontal and vertical equating, with the result that all five domain scales were put on the NAPLAN historical scales. These scales share the same set of cut-points separating the bands. The cut-points established for NAPLAN 2008 were used in 2009 through 2016 to ensure comparability of results across time.

Preliminary performance information based on the calibration sample

For reporting to parents, the national means, standard deviations, the 20th percentiles and the 80th percentiles for each domain and each year level were calculated using the 2016 calibration sample, with weights applied. Preliminary percentages in bands were also estimated for each domain and each year level. All the statistics obtained were expressed on the NAPLAN Reporting Scales and their respective standard errors (which included sampling, measurement, and equating error) were calculated. The multiple sets of plausible values were used to obtain an estimation of measurement error. Estimates of sampling and measurement error were combined to obtain final standard errors for the performance statistics reported for the sample.

4.4 Stage Two Analyses Based on Census Data

Using item parameters and scaling information as described in the stage one analyses, five sets of plausible values were drawn for each jurisdiction, based on a multidimensional item response model with conditioning on background variables for students in each of the year levels in each of the domains. The conditioning variables used were as described in section 4.3. Census data were analysed to produce national and jurisdiction results, on the full cohort and on subgroups, for national reporting.

4.5 The Estimation of Standard Errors

The estimation of standard errors for sample data

The NAPLAN student calibration samples were obtained through a random selection of schools: at the first stage, schools in each jurisdiction were sampled from a sampling frame (stratified by sector) with equal probability; at the second stage, all students from the sampled schools were selected into the sample. By using a cluster sampling technique, these samples are not simple random samples and the usual formulae to obtain standard errors for population estimates are not appropriate.

In general, secondary analyses with plausible values can be described as follows. If θ is the population parameter and θ_i is the statistic of interest computed on one set of plausible values, then:

$$\theta = \frac{1}{M} \sum_{i=1}^M \theta_i \quad (4.3)$$

with M being the number of plausible values.

The plausible values also allow the computation of the uncertainty in the estimate of θ due to the lack of precision of the test. If a perfect test could be developed, then the measurement

error would be zero and the M sets of statistics from the plausible values would be identical. Since no test is perfect, the M sets of statistics would not be identical. The *measurement variance* (also called the *imputation variance*) is equal to:

$$B_M = \frac{1}{M-1} \sum_{i=1}^M (\theta_i - \theta)^2 \quad (4.4)$$

It corresponds to the variance of the M plausible value statistics of interest. The final stage is to combine the sampling variance and the measurement variance to get the final variance V as follows:

$$V = U + \left(1 + \frac{1}{M}\right) B_M \quad (4.5)$$

with U being the *sampling variance* (the estimation of which is described below).

When combining the estimation of sampling and measurement error, the statistics have to be computed with full sample weight for each plausible value. To achieve this, SAS macros were used to analyse with the five sets of plausible values with properly weighted statistics.

The estimation of standard errors for census data

NAPLAN results from census data were reported with standard errors that included both sampling and measurement errors. The inclusion of sampling error might be considered surprising in that all students in the target year levels were included in the assessment. However, the aim of NAPLAN is to make inference about the educational systems each year and not about the specific student cohorts in 2016. In addition, even in census assessments there is a certain amount of non-response that must be taken into account.

Sampling error was considered at both the student and the school level. At the student level there is a random element from one year to another in respect of having different age cohorts at each year level. At the school level it needs to be considered that schools may be closed from one year to another or new schools may be opened.

However, as Levy and Lemeshow (1999) state:

In complex sample surveys, estimation of the variances of estimated population characteristics can be difficult either because of the way the sample was taken or because of the way the estimates of population characteristics were constructed. ... In such situations, the technique of linearization can be used to construct an approximation to the functional form of the estimated population characteristic that is a linear function of the original observations and hence is amenable to construction of a variance estimator. (p. 366)

This process of *linearization* or *Taylor series variance estimation* involves several steps. To look at a simple case, consider a population characteristic θ and assume that there exists an estimator $\hat{\theta} = f(x, y)$ such that the variables x and y are linear functions of the sample observations but that $f(x, y)$ is *not* a linear function of the sample observations. The next step is to use a first-order Taylor series to approximate $f(x, y)$. This results in an approximation that is linear in the variables x and y , and hence, linear in the sample observations. The final

step is to take this linear approximation, identify the sample design, and apply the design-based formula to estimate the variance (Levy & Lemeshow, 1999).

Taylor series variance estimation can be done using commercially available statistical software, and in the case of NAPLAN 2016, was implemented using the procedure PROC SURVEYMEANS in the SAS software package. SAS macros were written to combine the estimates of sampling error with the estimates of measurement error in the same way as was done for the sample data, and to obtain final standard errors for the performance statistics reported for the census data. The standard errors were used to determine statistical significance in mean differences in NAPLAN 2016 performance in the reports.

Two additional sets of standard errors were calculated, one set for the comparisons of means between 2016 and the baseline years, and one set for the comparisons of means between 2016 and 2015. These took into consideration, in addition to sampling and measurement errors, the errors due to the equating of measurement scales across administrations. See section 6.8 for a discussion of the estimation procedure used to calculate the standard errors of equating.

The calculation of effect size for census data

All significance testing is accompanied by an effect size measure, which indicates the magnitude of any change. The effect size for differences in means is given by *Hedge's g*, whose formula is:

$$g = \frac{m_2 - m_1}{s_p} \quad (4.6)$$

where m_1 is the sample mean of the first group, m_2 is the sample mean of the second group, and s_p is the pooled standard deviation, i.e. the square root of the pooled within-groups variance, weighted by number of cases in each group

$$s_p = \sqrt{\frac{(n_1 - 1)s_1^2 + (n_2 - 1)s_2^2}{n_1 + n_2 - 2}} \quad (4.7)$$

where n_1 and n_2 are the number of cases in groups 1 and 2, respectively, and s_1^2 and s_2^2 are their variances. This formula is known to yield a biased estimate for the population value and is corrected using the following formula:

$$g_{unbiased} = g_{biased} \left[1 - \frac{3}{4(n_1 + n_2 - 2)} \right] \quad (4.7)$$

4.6 Stratified Random Sampling and Multidimensional Linear Regression

As mentioned earlier, plausible values for the 2016 NAPLAN administration were obtained using a procedure that combined MDLR analyses of stratified random samples from the census data together with analyses of the complete census data. This procedure was first implemented during the 2015 administration and is described below. Figure 4.1 presents a flowchart showing the non-writing MDLR analysis.

Stratified random sampling Non-Writing MDLR

1. Separate the complete census data files by TAA.
2. Determine the number of cases for each TAA
 - a. If there are fewer than 7,200 cases in a TAA, then go to step 3 conducting the MDLR analysis on the complete census data for that TAA.
 - b. If there are 7,200 or more cases in a TAA, then, for each TAA, create a sample of 300 cases per level using the three stratification variables of *gender*, *geolocation* and *sector*.
 - c. Sort cases within a data file by the remaining background variables, and sample 300 cases via systematic sampling (every k^{th} case). If a particular stratum has 300 or fewer cases, then select all cases from that stratum.
3. Run MDLR analysis on stratified samples separately for each TAA, anchoring on the item difficulties from calibration sample, and estimate (output) regression coefficients for each demographic variable
 - a. Prior to these runs, evaluate each background regressor for each TAA to determine which ones can be included for the TAA in question.
 - b. Begin MDLR analysis with 2,000 nodes.
4. If convergence occurs, then output the estimation of the regression coefficients and go to step 6.
5. If convergence does not occur, then rerun MDLR, using the first results as starting values for regression coefficients, but increase the number of nodes to 2,500.
 - a. If convergence occurs, then output the estimation of the regression coefficients and go to step 6.
 - b. If convergence does not occur, then test to determine whether the ratio of the standard deviations of the PVs from consecutive runs is close to 1.00.
 - i. If it is, then output the estimation of the regression coefficients and go to step 6.
 - ii. If not, then consult with ACARA about the analysis results and next steps.
6. Anchor the item difficulties from the calibration sample and the regression coefficients from the final MDLR analysis based on the stratified samples. Now compute the PVs for the complete census data for each TAA separately. Begin MDLR analysis with 2,000 nodes.
7. If convergence occurs, output final PVs.
8. If convergence does not occur, then re-run MDLR analysis with 2,500 nodes.
 - a. If convergence occurs at 2,500 nodes, output final PVs.
 - b. If convergence does not occur, then test to determine whether the ratio of the standard deviations of the PVs from consecutive runs is close to 1.00.
 - i. If it is, then output the final PVs.
 - ii. If not, then consult with ACARA about the analysis results and next steps.

Writing MDLR Analysis

1. Writing responses are first combined and then divided into each TAA (i.e., total 8 data files).
2. MDLR analysis is run for each TAA, anchoring on the item difficulties from the 2011 base writing scale, and regression coefficients for each demographic variable are estimated. It should be noted that the categorical variables used in the model were gender, LBOTE status, Indigenous status, parental education, parental occupation, school geolocation and school sector, and the continuous variable was a measure of

average school ability, specifically the school writing WLE average score. Regressing variables for each TAA can be found in Appendix M (see Table M.5)

- Convergence criterion was set to 0.0001 and the minimum and maximum node values ranged from -15 to $+15$ logits.

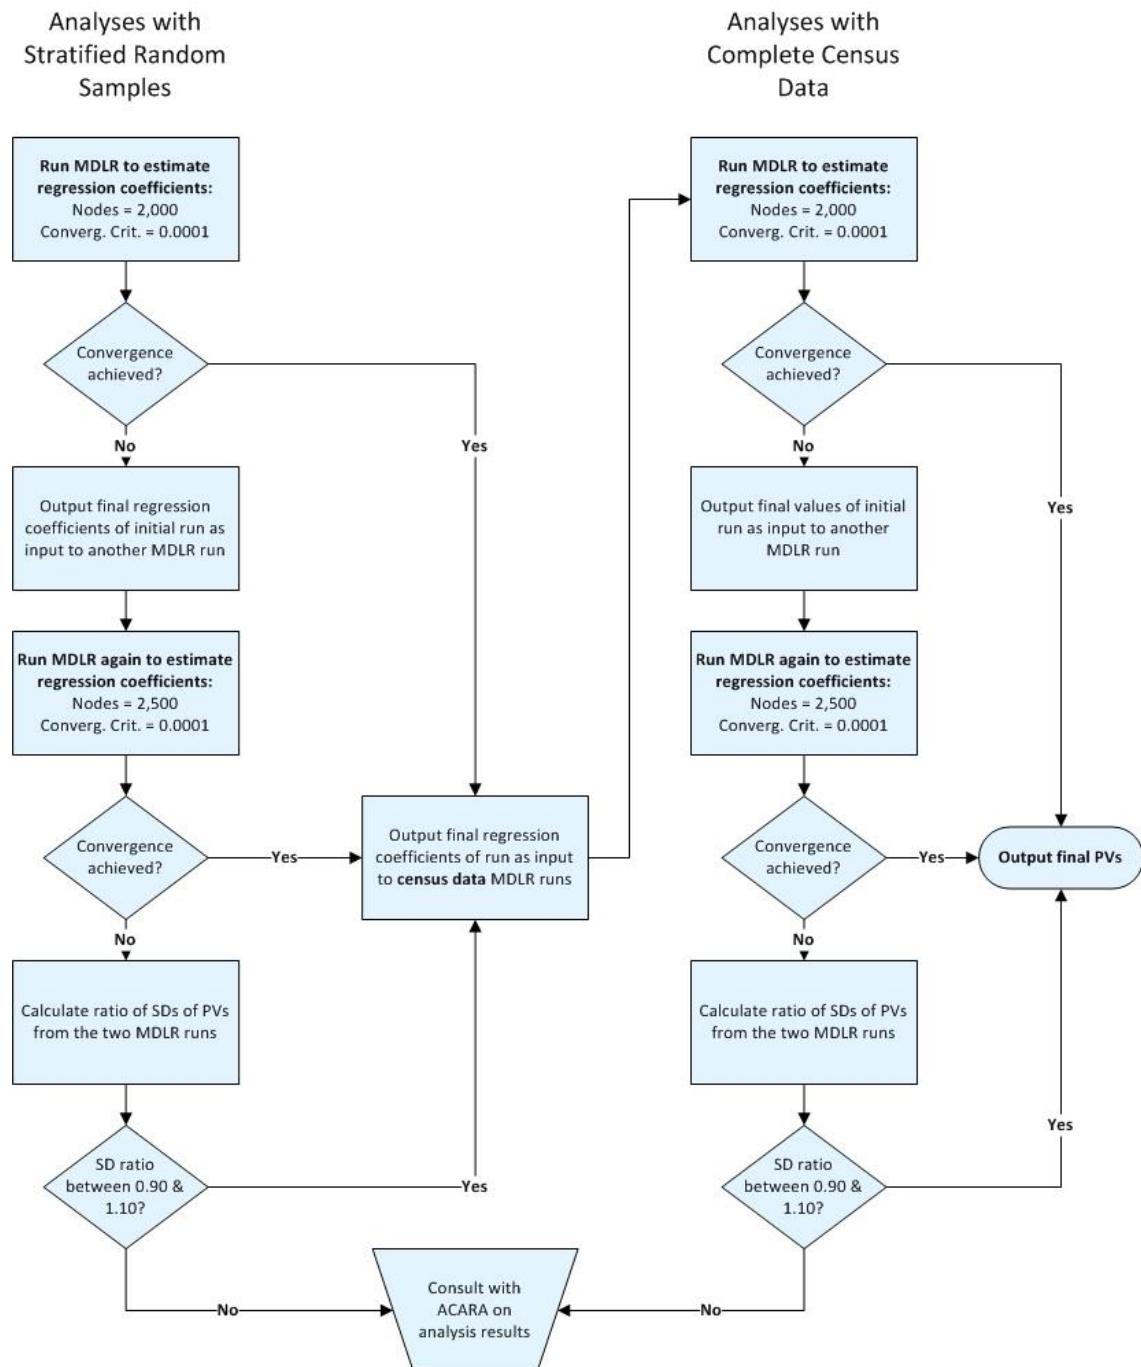

Figure 4.1. Non-writing MDLR process with TAAs (using stratified random sample).

CHAPTER 5. TEST CALIBRATIONS

This chapter describes the data preparation process, test calibration outcomes and differential item functioning (DIF) analysis outcomes.

5.1 Data Preparation

As in previous years, each TAA prepared its jurisdiction data according to a common codebook provided. Each TAA prepared four data files in ASCII format, one for each year level. The data files were uploaded to ACARA's secure File Transfer Protocol (FTP) site. The data were identified at the school level and delivered with school information necessary for the calculation of weights. This made it possible for the data analysis contractor to calculate the weights for each school and for each jurisdiction. The calibration sample data and student weights were then verified by an independent auditor.

Data Checking

All data files were checked for invalid codes and inconsistencies. Data were cleaned and recoded at UWA using specifically designed software. Any concerns about data were communicated to the TAA and rectified as necessary. Recoded data files were generated and verified in preparation for data analysis.

Rules for Data Recoding

Table 5.1 lists the test participation codes used in the data files and the rules for recoding the response string for each test.

Table 5.1. Rules for Data Recoding

Participation Code	Data Recoding Rule
P – Present	Data string (i.e. item responses) expected. Any embedded missing responses are indicated with 9s by the TAA, invalid responses with 8s. The first trailing missing response is to be kept as a 9; subsequent trailing-missing responses are unreached missing responses, and are to be recoded as M. Any embedded missing responses within the data string are kept as 9s. Students who are present but do not attempt any question will have a string of Ms.
A – Absent	A data string of all 9s for that test was expected from the TAA. Item data are recoded as a string of 7s.
S – Sanctioned Abandonment	This is specifically used to indicate students who unexpectedly abandon the test due to illness or injury. (Indicated as Partial Completion in 2008) There may be data, but these students will be treated as absent. All item data are recoded as a string of 7s.
W – Withdrawn	A data string of all 9s for that test was expected from the TAA. See National protocols for Test Administration section 1.6, 1.7. These students are treated as absent. Item data are recoded as a string of 7s.
E – Exempt	A data string of all 9s for that test was expected from the TAA. See National protocols for Test Administration section 1.2, 1.3 These students are not included in the calibration or in the calculation of means. Item data are recoded as a string of 7s.

A student in Year 7 or Year 9 who was absent or withdrawn for one of the two numeracy tests (calculator-allowed form and non-calculator form) was treated as an absent student only

for that particular test. Item data in the absent test were coded as a string of 7s. In recoding unreached missing responses, the two numeracy forms were treated separately. For students who were present for only one of the forms, their numeracy performance was based on only that form.

Language conventions was one test but reported as two domains. There were students who attempted only the spelling part or only the grammar and punctuation part. For the purpose of calibration, the unreached-missing coding was done separately for spelling and grammar and punctuation. A code of 9 was only used for the first of the unreached missing response, and the remaining missing values were recoded to M. The code of 9 was also used for embedded missing responses.

Missing data were not expected for writing. Students who were present but did not write anything (blank booklet) had their ratings coded as a string of 9s by the TAAs. These were then all recoded to M.

5.2 Test Calibrations

The reading, spelling, grammar and punctuation and numeracy tests were calibrated separately by domain and year level, resulting in 16 separate calibrations. In the estimation of parameters, all responses from a non-participating student (absent, withdrawn and exempt) were treated as missing, and the embedded missing response (9), the first trailing missing response (9) and the invalid response (8) were treated as wrong. Trailing missing responses beyond the first (M) were treated as missing. Senate weights were not used for item calibration. To ensure each state/territory was equally represented, a simple random sample was drawn from each state/territory's calibration sample to match the sample size of the smallest state/territory (Northern Territory).

In 2016, while students in Years 3 and 5 responded to one prompt for the writing assessment, students in Years 7 and 9 responded to another. The writing test from Years 3, 5, 7 and 9 were analysed concurrently, based on the partial credit model. The latent distribution was conditioned on year level.

All calibrations were conducted using *ACER ConQuest*. In addition, calibrations were conducted independently using *RUMM2030* as a method of checking the accuracy of the calibration process.

The *ACER ConQuest* item analysis results are in Appendix B. This is an item-by-item tabular display of classical item statistics: item facility, discrimination and point-biserial statistics, counts and percentages of each response option (for multiple-choice items), score-points (for scored items), Rasch item parameters and Infit mean square. The item parameters shown on these tables are delta-centred (i.e., the mean of item difficulties is set to zero) within each domain and year level, except for writing, where Years 3, 5, 7 and 9 are combined. Traditional test reliability, Coefficient Alpha, is presented at the end of the item analysis results for each test.

The Rasch item parameter estimates and statistics are summarised in Appendix C for each of the 17 tests. The item parameters shown in these tables are delta-centred for each test. The 95% confidence interval for the expected value of the Infit mean square is also provided for each item.

Item Characteristic Curves (ICCs) for all items are shown in Appendix D. The ICC plot shows a comparison of the empirical ICC based on observations from ten equal-size ability groupings (broken line joining ten dots) and the expected model-based ICC (smooth line). The two curves should display small or no disparities for an item that has good fit to the model. Since the ICC for a multiple-choice item also shows the proportion of students in each of the ten groups who responded to each distractor in the distractor response curves, the performance of distractors can be examined using the item analysis results and the behaviours of the response curves in the ICC plots.

5.3 Test Reliability and Average Item Discrimination

Test Reliability

Table 5.2 shows the coefficient alpha of each test. It should be noted that the language conventions test is reported as two domains for each year level: (1) spelling and (2) grammar and punctuation with 23-30 items each. While spelling items are in a constructed response format, grammar and punctuation items are in a multiple-choice format.

The coefficient alphas are between 0.85 and 0.90 for the reading tests, between 0.90 and 0.92 for the spelling tests, between 0.76 and 0.79 for the grammar and punctuation tests and between 0.84 and 0.93 for the numeracy tests. The reliability for the writing test is 0.95. The reliabilities are generally high with the exception of the reliabilities for the grammar and punctuation tests. The shorter multiple-choice tests may explain the slightly lower reliability for the grammar and punctuation tests.

Table 5.2. Coefficient Alpha for NAPLAN 2016 Tests

Year Level	Reading	Spelling	Grammar and Punctuation	Numeracy	Writing
3	0.90	0.90	0.79	0.84	
5	0.85	0.91	0.76	0.90	
7	0.87	0.92	0.78	0.93	0.95*
9	0.88	0.90	0.79	0.93	

*For all grades

Average Item Discrimination

Table 5.3 shows the average item discriminations for the reading, spelling, grammar and punctuation and numeracy tests. The average item discriminations for the reading tests range from 0.37 to 0.48, with the Year 7 test having the lowest average item discrimination. The spelling tests have the highest average item discriminations, ranging from 0.54 to 0.57. The averages for the grammar and punctuation tests are between 0.39 and 0.43, and those for the numeracy tests are between 0.40 and 0.45. The average item discriminations are also shown separately for the non-calculator (NC) and calculator (C) forms for Year 7 and Year 9 tests.

The unusually high average item discrimination (i.e., 0.83) for the writing test is likely due to the small number of highly correlated, polytomously scored criteria used in scoring across the span of grade levels.

Table 5.3. Average Item Discrimination for NAPLAN 2016 Tests

Year Level	Reading	Spelling	Grammar and Punctuation	Numeracy (ALL)	Numeracy (NC)	Numeracy (C)	Writing
3	0.48	0.55	0.43	0.40			
5	0.40	0.57	0.39	0.45			
7	0.37	0.54	0.39	0.44	0.42	0.46	0.83*
9	0.40	0.54	0.39	0.44	0.46	0.42	

*For all grades

5.4 Test Targeting and Item Spread

The purpose of the Wright map (or variable map) is to compare the locations of the students (on the left side of the map) and the item thresholds (on the right side of the map). Item, step and person parameters are most efficiently and meaningfully displayed in a Wright map, which plots the parameters on their common scale (Bond & Fox, 2001). Appendix E provides the Wright maps for the domains and year levels.

For dichotomously scored tests, the maps are constructed so that a student has a 50% chance of answering an item correctly when the item is at a difficulty level that is at the same level as the student's ability. On each variable map, the mean of the item estimates was centred at zero. Students at the top end of the distribution have higher proficiency estimates, while items at the top end are the more difficult items.

Figure 5.1 displays the Wright map for Year 3 Numeracy. That Wright map indicates that this sample's numeracy achievement level has been well targeted by the current test. The distribution of persons (each X represents approximately 8 persons) matches up well with the distribution of item thresholds, which indicates that the ability levels of the population were well represented at all levels of the test.

For the polytomously scored tests (e.g., writing), on the other hand, the criterion difficulty of each of the ten rating criteria is plotted in the middle panel with the latent ability distribution on the left-hand side. Each criterion is polytomously scored. The right-hand panel of Figure E.5 shows locations of the Thurstonian thresholds of each item. The notation $a.b$ indicates threshold b of criterion a . The location of the threshold indicates the ability level required for a student to have 50% chance of achieving category b or better on criterion a . The variable maps show that the thresholds are well spread out and well separated.

5.5 Item Fit

The evaluation of goodness of fit to the Rasch model for individual items was based on the weighted mean square (i.e., Infit mean square) statistics. Infit compares the actual residuals to how much of the variation is expected if the data fit the model (Wilson, 2005). A value greater than the expected value of 1.0 indicates that the item responses contain a greater amount of variability than expected by the model, and a value below 1.0 indicates that the consistency between observed data and model-based predictions is better than expected. We used an Infit value of 1.20 as the criterion value for evaluating the goodness of fit of each item, i.e., Infit values greater than 1.20 indicate item under-fit. We also calculated classical item statistics (i.e., discrimination and facility) for the purpose of item fit evaluation, specifying criterion values for discrimination (i.e., item-total score correlation) less than 0.25 and facility outside the range of 0.10 to 0.90. Values of the Infit mean square and classical item statistics of each item can be found in Appendices B and C.

As mentioned in section 5.2., the ICC of each item shows a comparison of the empirical ICC based on observations from ten equal-size ability groupings (broken line joining 10 dots) and the expected model-based ICC (smooth line), and the two curves should display small or no disparities for an item that has good fit to the model. The ICCs for all items can be found in Appendix D.

Reading, Spelling, Grammar and Punctuation, and Numeracy

Item fit to the Rasch model was closely examined for reading, spelling, grammar and punctuation and numeracy at each of the four year levels. As all items were trialled and examined previously, few items should show misfit. Because of the large size of the calibration sample, the confidence intervals for the Infit mean squares were rather narrow.

Table 5.4 presents the number of items falling into two Infit mean square ranges: less than or equal to 1.20, and greater than 1.20. It also presents the number of items with discrimination less than 0.25 and the number of items with facility outside the range of 0.10 to 0.90. As seen from the table, there were 13 items having Infit greater than 1.20. Regarding classical test statistics, there was a total of 26 items across the 16 tests with discrimination less than 0.25. There was a total of 26 items with facility higher than 0.90 and 16 items with facility less than 0.10. Figure 5.2 shows the ICC of one reading item (i.e., Item r3q06) with an Infit statistic close to 1.07. In contrast, Figure 5.3 shows the ICC of one numeracy item (i.e., Item n9NCq12) with an Infit statistic (i.e., 1.27) higher than the criterion value (i.e., 1.20) for evaluating the goodness of fit of each item.

Writing

The evaluation of goodness of fit to the Rasch model for individual writing items was also based on the weighted mean square statistics. None of the criteria exhibited misfit to the Rasch partial credit model except for paragraphing and punctuation (i.e., 1.61 and 1.27, respectively). Regarding the ICCs, there were not large differences between the empirical and the expected curves for each of the ten criteria. The ICCs of the ten writing criteria are also included in Appendix D.

Table 5.4. Summary of Item Statistics in NAPLAN 2016 Tests

Domain	Year	Total Number of Items	Number of Items with Discrimination < 0.25	Number of Items with		Number of Items with	
				Infit ≤ 1.20	Infit > 1.20	Facility > 0.90	Facility < 0.10
Reading	3	38	0	37	1	2	0
	5	38	4	37	1	5	1
	7	50	5	50	0	2	0
	9	50	2	50	0	3	0

5.6 Differential Item Functioning (DIF) Analyses

According to Camilli and Shepard (1994), item response theory can be used to assess DIF. Specifically,

[i]tem characteristic curves provide a means for comparing the responses of two different groups . . . to the same item. A difference between the ICCs of two groups indicates that . . . examinees [for the two groups] at the same ability level do not have the same probability of success on the item. More technically, DIF is said to occur whenever the conditional probability, $P(\theta)$, of a correct response differs for two groups. (Camilli & Shepard, 1994)

In the analysis for NAPLAN, subgroups were arbitrarily categorized as either reference or focal groups. While males, non-LBOTE students, and non-Indigenous students were assigned to the reference group, females, LBOTE students, and Indigenous students were assigned to the focal group for DIF analyses. As mentioned in Chapter 4, independent Rasch analyses were then performed over the same set of items for each subgroup in order to examine any DIF that exists between two subgroups (e.g., males vs. females). The mean item difficulty for each subgroup was centred at zero to adjust for group differences in ability. The difference in the relative item difficulties after adjustment is referred to as the adjusted difference.

For visual depiction of DIF, item locations of the reference group were plotted against those of the focal group as seen from Appendices F, G and H (i.e., gender, LBOTE, and Indigenous status, respectively). Each item is represented by one point on the plot. A diagonal line is plotted as the reference line. If the relative item difficulty for an item is not different in the two groups after taking their relative performance on the test into account, the point representing the item will be on the reference line. The distance of a point from the diagonal reflects the magnitude of DIF. Due to the large sample sizes, confidence bands were very narrow and were not plotted on the charts.

Finally, Tables 5.5, 5.6, and 5.7 summarize the total number of items indicating potential DIF with an absolute adjusted difference of 0.50 or greater for gender and language background (LBOTE), and 0.60 or greater for Indigenous DIF. Figures 5.3, 5.4, and 5.5 are examples of the potential DIF items. DIF values of individual items for gender, LBOTE, and Indigenous status are presented in Appendix I.

Gender DIF

Appendix F presents the scatter plots for examining gender DIF in the five domains by the four year levels except for the writing test. Writing gender DIF was performed by combining all four grades. On the whole, the plots indicate that there are few items that exhibit gender differences in the adjusted item estimates and that any differences are not large and thus were not of great concern.

Table 5.5 identifies the number of items that show potential gender DIF with an absolute adjusted difference of 0.50 or greater, and Figure 5.3, for example, shows one spelling item (Item lc9q20) with an absolute adjusted difference of 0.50 or greater. An item with a positive adjusted difference indicates that the item was relatively easier (i.e., 0.52) for female students. Appendix F includes DIF plots that show for each of the items the observed curves by gender group compared to the expected ICC.

LBOTE DIF

Appendix G shows scatter plots for examining DIF due to language background in the five domains by the four year levels. Writing LBOTE DIF was performed by combining all four grades. These plots indicated that there were not many items that showed notable differences in the relative item difficulties.

Table 5.6 indicates a total of items that show potential DIF with an absolute adjusted difference of 0.50 or greater. Figure 5.4 depicts one grammar and punctuation item (Item lc5q37) with an absolute adjusted difference of 0.50 or greater. This item was relatively easier (i.e., 0.86) for non-LBOTE students.

Appendix G includes DIF plots that show for each of the items the observed curves by language group compared to the expected ICC.

Indigenous Status DIF

Appendix H includes scatter plots for examining Indigenous DIF in the five domains by four year levels. Writing Indigenous DIF was performed by combining all four grades. These plots showed that there were not many items that showed notable differences in the relative item difficulties.

Table 5.7 lists a total of items that show potential Indigenous DIF with an absolute adjusted difference of 0.60 or greater. The larger value (i.e., 0.60 instead of 0.50) was used in order to identify only the items that showed larger DIF. Figure 5.5 depicts one numeracy item (Item n3q06) with an absolute adjusted difference of 0.60 or greater. This item was relatively easier (i.e., 0.70) for non-Indigenous students.

Appendix H provides the item DIF plots for items listed in Table 5.7. The plots show for each of the items, the observed curves by Indigenous group compared to the expected ICC. In interpreting the plots, it should be noted that there may not be many Indigenous students along parts of the ability range. As a result, one would expect larger variability of empirical probabilities (i.e., the dots connected by dashed lines) about the model-based curve (the solid curves).

State/Territory DIF

The number of items showing state/territory related DIF with an absolute adjusted difference of 0.50 or greater in reading, spelling, grammar and punctuation and numeracy are listed in Table 5.8. In the heading of Table 5.8, 'E' indicates that the item is relatively easier for the jurisdiction, and 'H' indicates that the item is relatively harder for the jurisdiction. There were 4 items in reading, 5 items in spelling, 5 items in grammar and punctuation and 10 items in numeracy across all four year levels that showed potential DIF for some jurisdictions. The total number of items showing state/territory DIF may not match with the sum of the cells in each domain because the same items may be flagged in multiple jurisdictions. Table 5.8 can be read in conjunction with Appendix I, from which the items showing state/territory related DIF can be identified.

To examine the state/territory DIF for the writing test, the expected score curves of ten rating criteria were plotted for the eight states/territories in Appendix J. None of the criteria showed notable differences across states/territories.

Table 5.5. Number of Items Showing Gender DIF by Domain by Year Level

Year Level	Reading		Spelling		Grammar and Punctuation		Numeracy	
	Total of Test Items	Total of DIF Items	Total of Test Items	Total of DIF Items	Total of Test Items	Total of DIF Items	Total of Test Items	Total of DIF Items
3	38	0	25	2	26	0	35	1
5	38	1	25	1	26	0	40	2
7	50	1	30	2	28	0	64	2
9	50	1	30	3	28	2	64	7

Table 5.8. Number of Items Showing State/Territory DIF by Domain by Year Level

Domain	Year Level	ACT		NSW		NT		QLD		SA		TAS		VIC		WA	
		E	H	E	H	E	H	E	H	E	H	E	H	E	H		
Reading	3	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
	5	1	0	0	0	0	2	0	0	0	0	0	0	0	0	0	0
	7	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	9	1	0	0	0	0	1	0	0	0	0	0	0	1	0	0	0
Spelling	3	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	1
	5	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
	7	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
	9	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
GP	3	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
	5	1	0	1	0	0	1	0	0	1	0	0	0	0	0	0	0
	7	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	9	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0
Numeracy	3	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	5	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
	7	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
	9	0	0	1	0	1	2	0	1	2	1	0	0	2	1	1	0

Note. 'E' indicates that the item is relatively easier for the jurisdiction, and 'H' indicates that the item is relatively harder for the jurisdiction. Because the same items may be flagged in multiple jurisdictions, the total number of items showing state/territory DIF may not match with the sum of the cells in each domain.

CHAPTER 6. EQUATING PROCESS

NAPLAN results are reported using five national achievement scales, one for each of the assessed domains of literacy—reading, writing, spelling and grammar and punctuation—and one for numeracy. The vertical and horizontal equating design is represented schematically in terms of the data matrix in Figure 6.1. Each year in NAPLAN, the scales are vertically equated so that each NAPLAN achievement scale spans Years 3, 5, 7 and 9; i.e., scales are aligned so there is a single scale for each assessment domain. All assessments other than writing are vertically equated by including common items in tests administered to adjacent year levels; namely, Years 3 and 5, Years 5 and 7 and Years 7 and 9. The responses to the common items are represented as the shaded columns in Figure 6.1 that overlap between adjacent year levels. For the purpose of monitoring student achievement over time, the 2016 NAPLAN scale for each domain needs to be horizontally equated to the historic NAPLAN reporting scale.

Because NAPLAN test materials are considered in the public domain after the tests are administered, it is not possible to use common items to horizontally equate the tests over time. Instead, common-person equating is used. The secure equating test forms used for horizontal equating in 2009 through 2015 were used for common-person equating again in 2016, noting that some of the secure forms have been modified or updated. Students from Years 3, 5, 7 and 9 in the equating sample were administered the secure equating forms at their year level in addition to the 2016 main NAPLAN test forms. The equating data were used to equate the 2016 tests onto the existing NAPLAN reporting scales.

The horizontal equating provides one basis for placing the 2016 NAPLAN Year 3, Year 5, Year 7 and Year 9 tests on the vertical NAPLAN scale for each domain because item locations for the secure forms are on the NAPLAN scale. The common items in the tests administered to adjacent year levels also provide a basis for vertically equating the scales. As in previous years, the results of common person equating were checked against the results of 2016 common-item vertical equating and both sets of results were taken into consideration in finalising the scaling of the reading, spelling, grammar and punctuation and numeracy tests.

In 2016 a narrative writing task was administered in NAPLAN and the resulting scale was equated to the existing persuasive writing scale. In 2016 as in the previous year, one task was administered to Year 3 and 5 students and a different task was administered to Year 7 and 9 students. The process of equating writing is described in section 6.6.

6.1. Horizontal Equating for Reading, Spelling, Grammar and Punctuation and Numeracy

The horizontal equating design for all tests other than writing involved a two-step procedure that combines common-person and common-item test equating methods. The common-person equating was achieved through the equating sample. The equating was carried out using secure equating forms that were administered with the NAPLAN 2016 tests for reading, spelling, grammar and punctuation and numeracy. Each student in the equating sample completed an equating form in addition to the NAPLAN 2016 tests that the full cohort to which they belong completed. Figure 6.1 shows the horizontal equating design for each of reading, spelling, grammar and punctuation and numeracy at each year level.

The secure equating form for each domain at each year level had already been scaled onto the historic NAPLAN scale in 2009. The first step is to place the NAPLAN 2016 test and the equating form on the same scale, for each domain at each year level, using the common-person equating

data. The second step is to equate each of the NAPLAN tests onto the historic NAPLAN domain scale using the relevant equating form through the process of common-item equating.

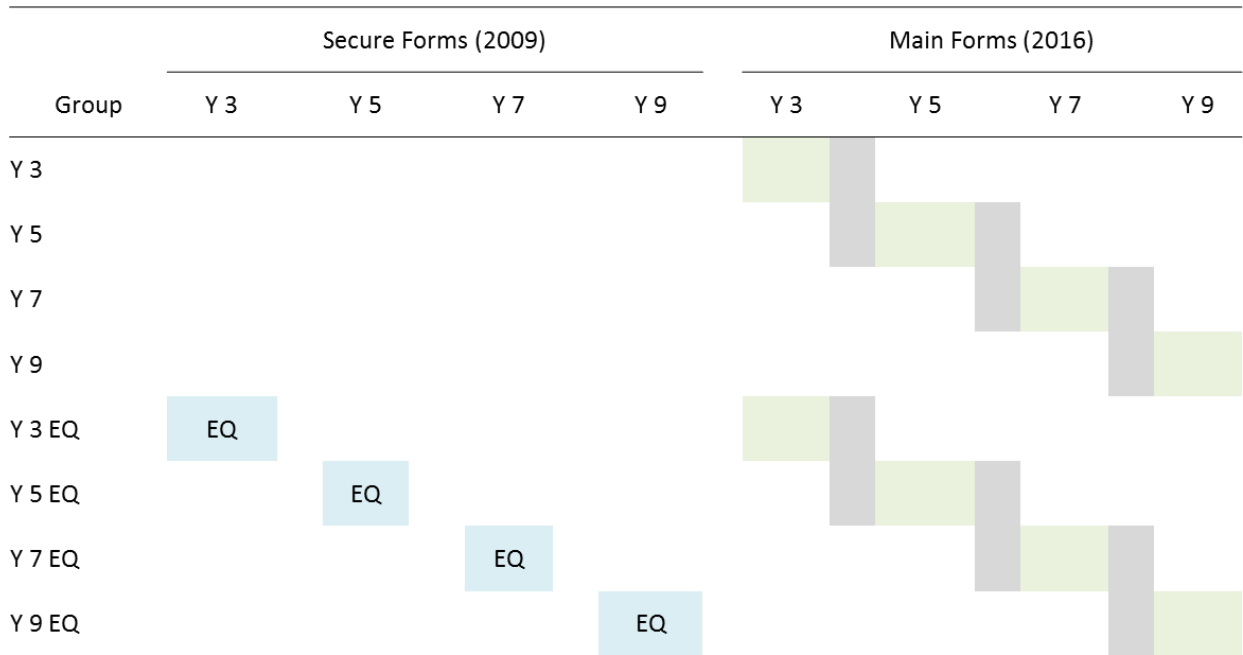

Figure 6.1. Equating design for each assessment domain.

The vertical scales were originally established in 2008. In each new calendar year, link items are included in the tests for adjacent year levels and new vertical equating is conducted. This provides the basis for obtaining new estimates of vertical shift constants to equate vertical tests. The tests are equated back using the secure forms. The secure forms are on the original scale.

Consequently, there are two ways of vertically equating. First, the tests have direct vertical links. Second, the horizontal equating through equating forms places the items on the original scale, which had vertical links. Therefore, the horizontal equating provides indirect vertical links that ideally will agree with the direct links. In most cases, there was a reasonable level of agreement between the horizontal and vertical links.

6.2 Calibrations of the Equating Forms and Item Reviews

Test calibrations were carried out separately for each of the 16 equating test forms (four domains at four year levels). The equating form and the corresponding 2016 test were jointly calibrated for each domain and each year level using the combined common-person equating data.

The analyses of the equating data described above provided a set of item parameters on the preliminary NAPLAN 2016 scale for each of the equating forms. The set of 2016 equating form item estimates was then compared with the item estimates on the historic NAPLAN scale from 2009 equating for each equating form. Items were considered for deletion as links if they functioned poorly based on MnSq indices and ICCs and/or if their relative locations differed by an absolute value of greater than 0.3 compared with their locations on the original 2009 scale for the relevant secure form.

Figures 6.2 to 6.17 show the comparisons of the 2009 item parameters and 2016 item parameters for items on each of the 16 equating tests. Each figure shows a pair of parameter plots of the linked items, before and after review, in each domain and for each year level. Ideally, the bivariate points would follow the identity line, which is shown in each figure for reference as a solid line.

Some equating items were slightly modified to improve the links over time. These items are omitted from the plots because they cannot be expected to have comparable locations. Certain items, particularly in the Reading tests in 2011, have been added to replace other items and the locations were placed on the NAPLAN scale in the first year they were used. These items were used as links in subsequent years.

Figure 6.2. Links review for Reading equating form Year 3 (2016 vs. 2009).

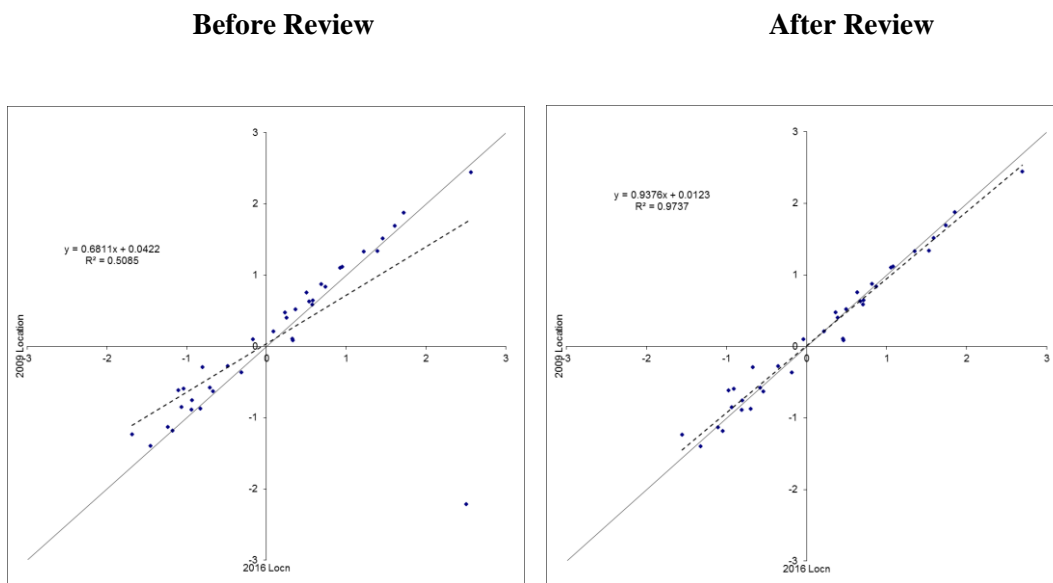

Figure 6.3. Links Review for Reading equating form Year 5 (2016 vs. 2009).

Figure 6.4. Links Review for Reading equating form Year 7 (2016 vs. 2009).

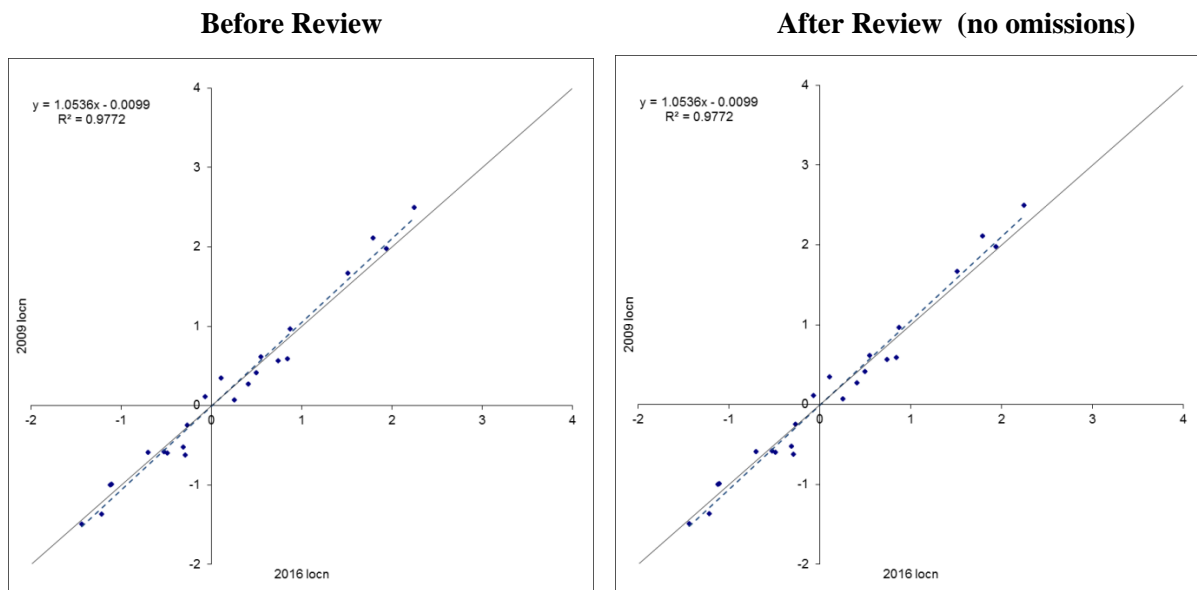

Figure 6.11. Links Review for Grammar and Punctuation equating form Year 5 (2016 vs. 2009).

Figure 6.12. Links Review for Grammar and Punctuation equating form Year 7 (2016 vs. 2009).

Figure 6.13. Links review for Grammar and Punctuation equating form Year 9 (2016 vs. 2009).

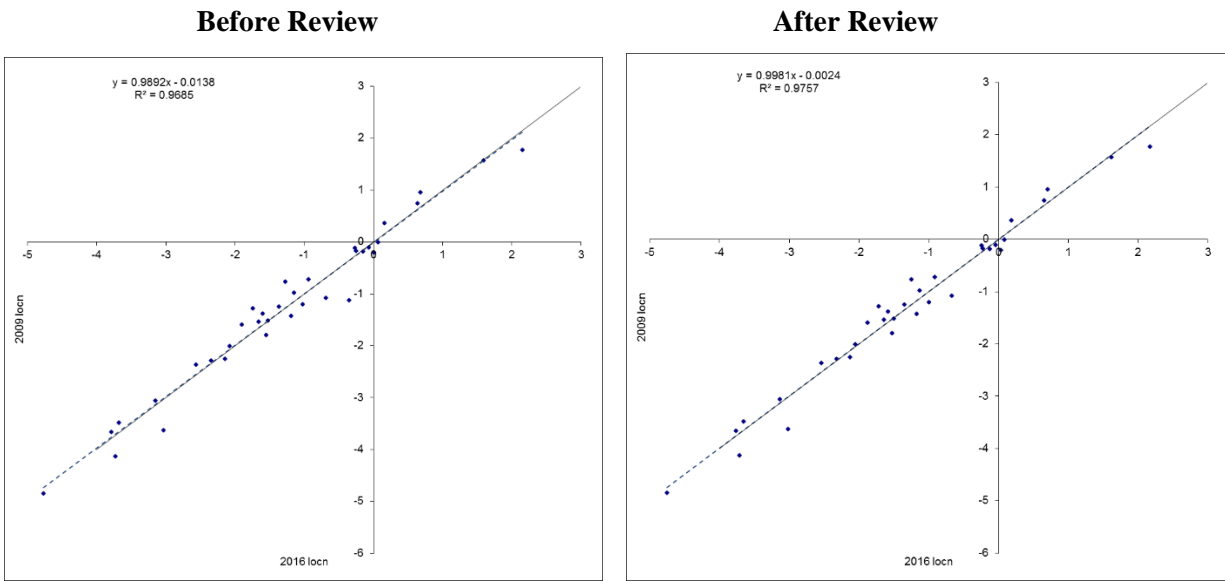

Figure 6.14. Links review for Numeracy equating form Year 3 (2016 vs. 2009).

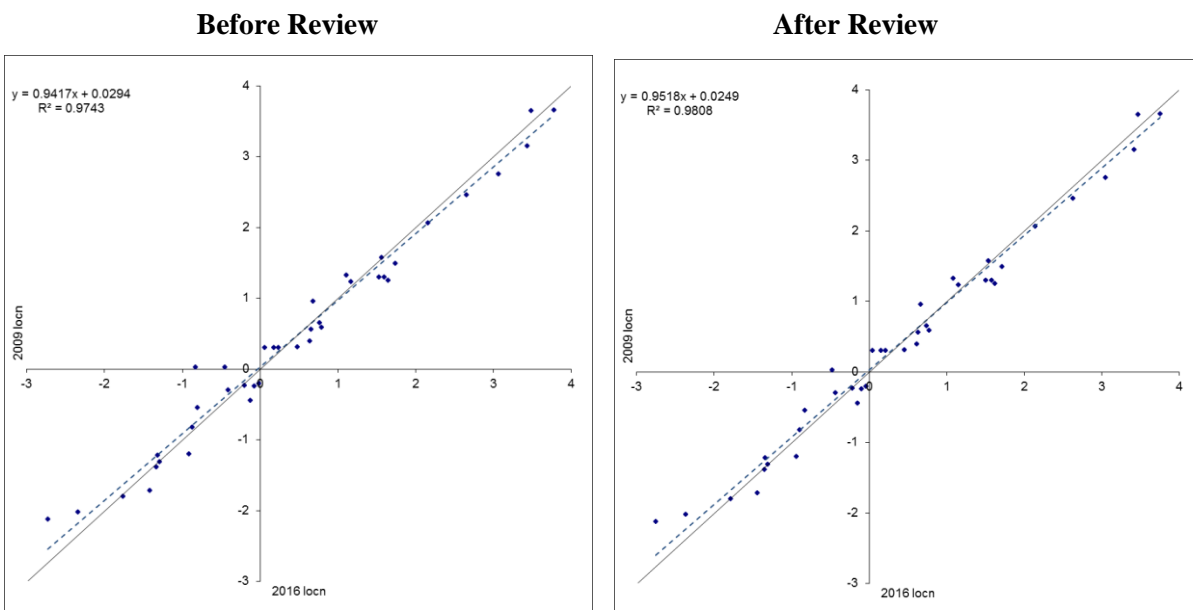

Figure 6.15. Links review for Numeracy equating form Year 5 (2016 vs. 2009).

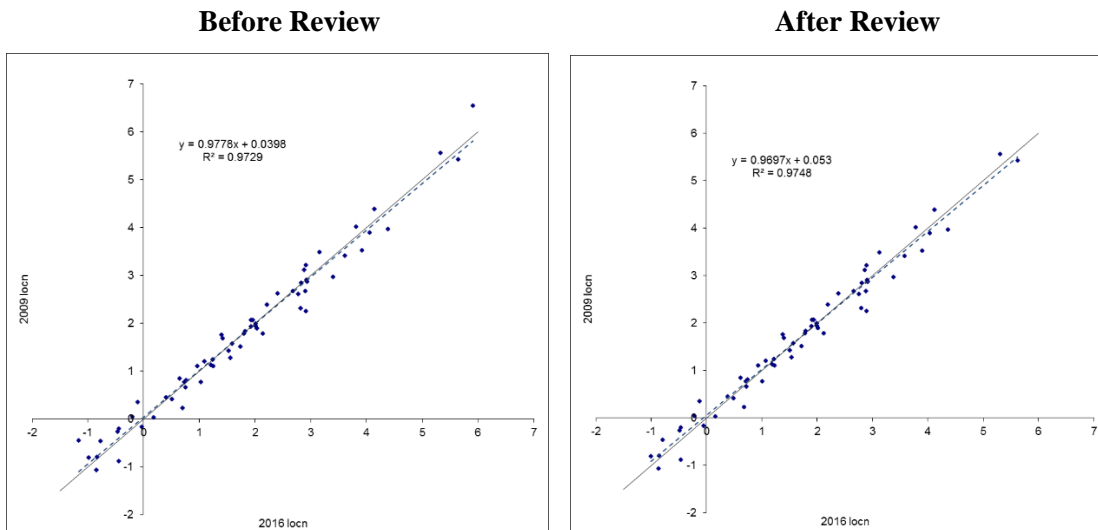

Figure 6.16. Links review for Numeracy equating form Year 7 (2016 vs. 2009).

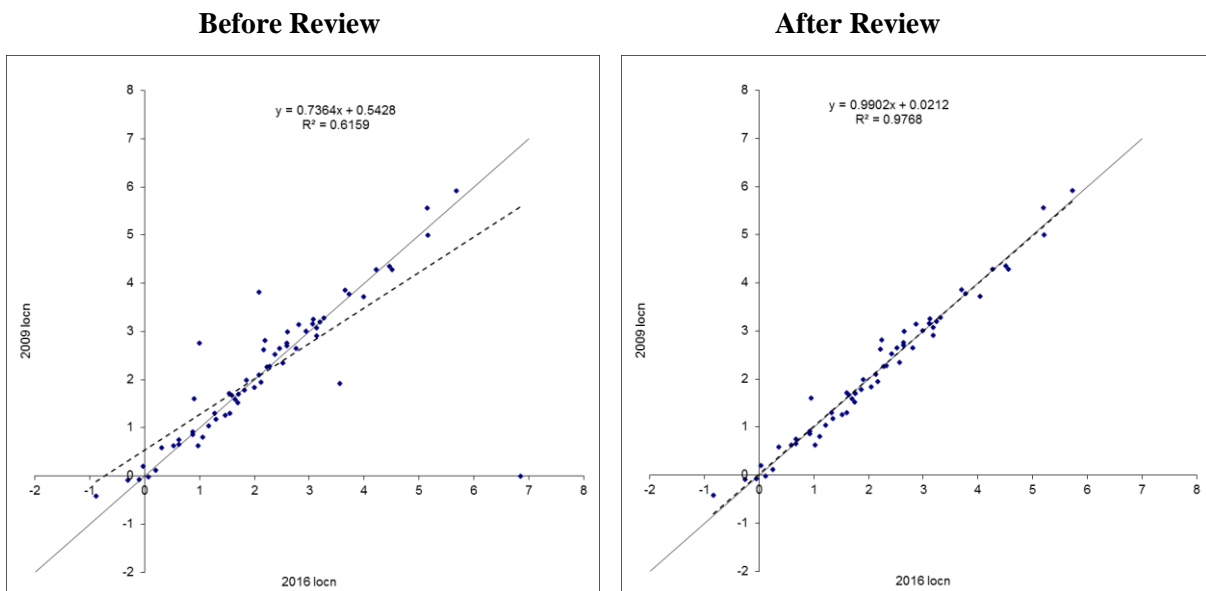

Figure 6.17. Links review for Numeracy equating form Year 9 (2016 vs. 2009).

As part of the equating process, the secure equating forms were calibrated jointly with the NAPLAN 2016 forms based on response data from an equating group of students. The locations of the equating items from the 2016 calibrations were compared with their locations from the 2009 calibration. For each domain and each year level, a final set of link items was identified. The final link items were used to calculate the shift to be applied to equate the 2016 equating forms onto the historic NAPLAN reporting scale, thus aligning the 2016 scale with the historic NAPLAN reporting scale.

Table 6.1 lists the horizontal shift-constants for each domain at each year level. The shifts are those required to equate the mean of the final set of link items for each domain and year level, based on the 2016 calibration, with the 2009 item locations of the same set of link items.

Table 6.1. Horizontal Shifts for Equating the 2016 Item Locations with 2009 Item Locations

Year Level	Reading	Spelling	Grammar & Punctuation	Numeracy
Year 3	-0.710	-0.896	-0.015	-1.124
Year 5	0.421	0.824	0.752	0.172
Year 7	1.534	2.421	1.423	1.482
Year 9	1.886	3.426	1.963	2.266

The horizontal equating of each of the 2016 NAPLAN domain scales in reading, spelling, grammar and punctuation and numeracy to the corresponding historic NAPLAN scales had provisionally put each of these domain scales on the vertical NAPLAN scales. The vertical scales, however, were constructed based on the original vertical equating of the tests. These original results were compared with the vertical equating results based on the 2016 tests and both sets of results were taken into consideration in determining the final shifts. The vertical equating of the 2016 tests is described in the next section.

6.3 Common-Item Vertical Equating of NAPLAN 2016 Tests

As in previous years of testing, the 2016 NAPLAN reading, spelling, grammar and punctuation and numeracy tests were vertically equated across Years 3, 5, 7 and 9 using link items embedded in tests in adjacent year levels. The quality of these link items was systematically reviewed for each domain. Only items that were considered to be good link items were used in the vertical equating.

Starting with the separate calibration of each test and using delta-centred item parameters, a vertical scale was constructed by determining the shift-constants (translation) between adjacent tests to equate the common items such that the tests are on a common scale.

A common item was considered for omission (i.e. not to be used as for vertical linking purposes) based on the fit of the item and evidence for differential item functioning (DIF). An overarching principle, agreed in previous years, was to maximise the number of links retained where possible. In practical terms, the adoption of this principle means erring on the side of using a link where there is doubt regarding the justification and basis for its omission.

A four-stage process was used, as detailed to follow. In each stage, the transformed/equated estimates for the year level being equated to the other are used. For example, use Year 5 estimates and compare these with Year 3 estimates equated to Year 5 estimates using the provisional shift constant at the relevant point in the process.

Vertical Equating Stages

The vertical equating process was undertaken in four stages as follows:

Stage 1. Initial cross-year scatterplots with all items are examined to ascertain the overall correlation and to note any patterns and outliers.

Stage 2. Each item is checked for misfit at each year level based on: inspection of the item characteristic curve (ICC) and graphical fit; the magnitude of the Outfit index; and the discrimination/slope estimate. Items that have no pronounced misfit in either year level form the reference set provided there are sufficient items.

Stage 3. Items that have high or low discrimination are identified and omitted if their inclusion affects the shift constant in the predicted direction. The effect is judged based upon changes in the shift constant for all items other than those omitted relative to the shift obtained for the reference set alone. For example, omitting a highly discriminating item may reduce the absolute magnitude of the shift based on the inclusion of all items such that it is more similar to the shift constant based on items in the reference set alone. If so, the relevant item would be omitted if the change is sufficiently large and if there are sufficient items available.

Stage 4. Items are omitted that show cross year-level DIF that affects the vertical shift.

Decisions to omit items due to misfit are not necessarily based on any one indicator in isolation; rather, decisions are based on all available evidence concerning the functioning of each item. Items that fail some criteria are normally excluded from the reference set but may have been retained if the total number of functioning links was relatively small.

Items were considered for deletion in the third stage based on high or low discrimination, and based on visual inspection of the level of discrimination evident in the ICC for the item. Detailed comments were made about the functioning of each potential vertical link item, including the degree of discrimination and whether there is evidence of guessing. The reason for this stage is that when using the Rasch model to vertically equate, high discrimination is predicted to inflate the absolute shift constant whereas low discrimination is predicted to deflate the absolute shift constant (Humphry, 2007). This method typically gives similar results to omitting items on the basis of DIF criterion. However, the purpose of this additional stage is to avoid using a set of items with misfit for basing decisions about DIF.

At the last stage, items were considered for deletion based on DIF if the absolute adjusted difference was greater than 0.3 and if the absolute standardised difference was greater than 10. This is the criterion for DIF used since the inception of NAPLAN.

After each stage, the cross-year level scatterplot was evaluated with a focus on the agreement of bivariate data with the identity line. The ratio of the standard deviations of the item locations was checked for each adjacent year level (e.g., Year 3 SD/Year 5 SD). Ideally the ratio should fall between 0.9 and 1.1. If there were insufficient items to evaluate the correspondence of the data with the identity line, it was necessary to relax the criteria applied in earlier stages of the method.

Three sets of link items (Year 3 and Year 5, Year 5 and Year 7, Year 7 and Year 9) were reviewed for each of the four domains. In each domain, the items administered to each year level were calibrated separately. For each pair of adjacent tests with common items, mean item parameters of

the common items were calculated for the tests administered to each of the two year levels. The vertical shift is the difference between the two means. The first vertical shift was applied to equate common Year 3 and Year 5 items by adjusting the Year 3 locations. The second vertical shift was applied to equate common Year 7 items with the common Year 5 items. The third vertical shift was applied to equate common Year 9 items with the common Year 7 items. The vertical shifts were computed based on the delta-centred item locations, i.e., based on standard constraint that the mean item location is 0. Thus, the vertical scale is centred about the Year 5 item locations.

In each case, the vertical shift is a constant that needs to be applied so that the mean adjusted difference is zero, i.e., so that the means of item locations for common items in adjacent year levels are equal. This permits the comparison of relative difficulties of the common items in the two tests. The standardised differences for each common item were also calculated.

For each pair of adjacent tests, one set of item parameters was then plotted against the other set of item parameters. Two plots are presented below for each review: one plot for the full set of common items before review and one plot for the retained link items after review. On the plots, each dot represents a common item. The 24 plots are shown in Figure 6.18 to Figure 6.29.

Vertical Equating of 2016 Reading Tests**Reading – Year 3/Year 5**

Figure 6.18 shows the Year3/Year 5 reading links before and after review. Two items were omitted. Of these, one omitted due to high discrimination that affected the shift in the direction predicted. The other showed cross-year level DIF beyond the criterion level.

Figure 6.18. Links review for Reading Year 3 and Year 5.

Reading – Year 5/Year 7

Figure 6.19 shows the Year5/Year 7 reading links before and after review. Four items were omitted. Of these, two had high discrimination that affected the contribution to the shift constant in the predicted direction. The other two had low and very low levels of discrimination that affected the shift constant in the prediction direction.

Figure 6.19. Links review for Reading Year 5 and Year 7

Reading – Year 7/Year 9

Figure 6.20 shows the Year 7/ Year 9 reading links before and after review. Only one item was omitted, which item showed DIF and also had high discrimination that affected the shift constant in the predicted direction.

Figure 6.20. Links review for Reading Year 7 and Year 9.

*Vertical Equating of Spelling Tests**Spelling – Year 3/Year 5*

The Year 3/Year 5 vertical equating is summarised in Figure 6.21. No omissions were necessary.

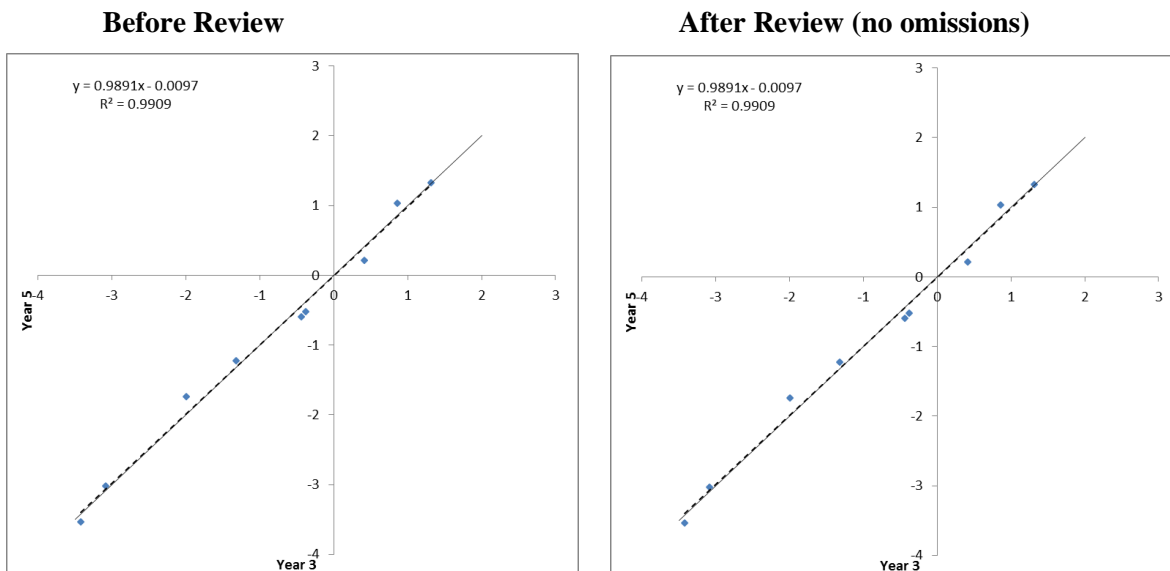

Figure 6.21. Links review for Spelling Year 3 and Year 5.

Spelling – Year 5/Year 7

The Year 5/ Year 7 links are shown in Figure 6.22. One item was omitted due to cross-year level DIF.

Figure 6.22. Links review for Spelling Year 5 and Year 7.

Spelling – Year 7/Year 9

The Year 7/ Year 9 links are summarised in Figure 6.23. One very easy item was omitted due to cross-year level DIF.

Figure 6.23. Links review for Spelling Year 7 and Year 9.

Vertical Equating of Grammar and Punctuation Tests

Grammar and Punctuation – Year 3/Year 5

Figure 6.24 shows the Year 3/Year 5 grammar and punctuation scatterplots before and after review. Two items were omitted: one due to high discrimination and which also exceeded the DIF criterion, the other due to cross-year level DIF.

Figure 6.24. Links review for grammar and punctuation Year 3 and Year 5.

Grammar and Punctuation – Year 5/Year 7

Figure 6.25 shows the bivariate locations of the Year 5/Year 7 grammar and punctuation link items before and after review. Three items were omitted. All exceeded the DIF criterion and there was noticeable misfit for one of the items.

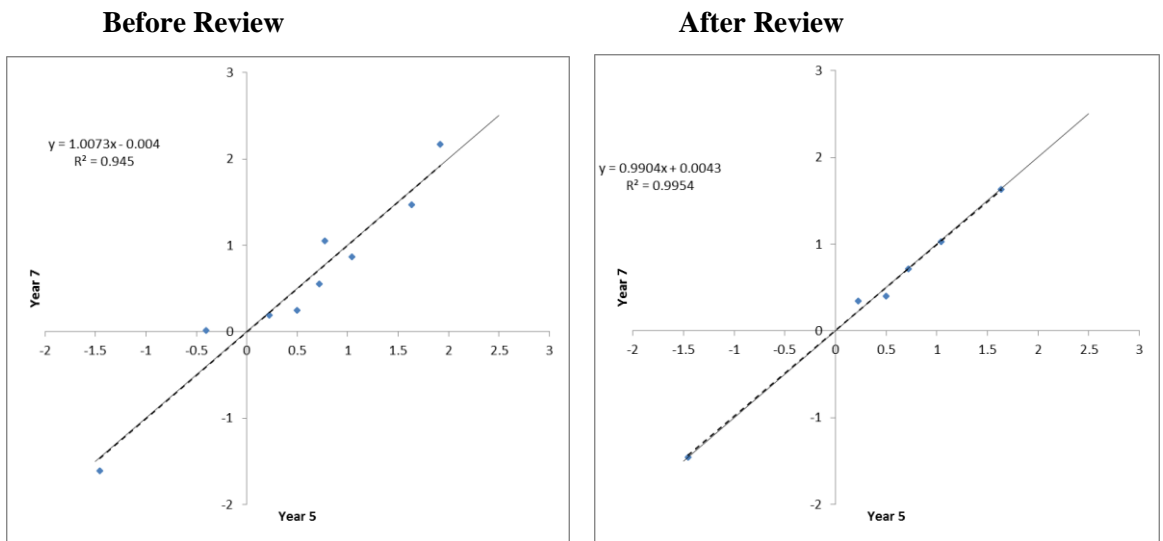

Figure 6.25. Links review for grammar and punctuation Year 5 and Year 7.

Grammar and Punctuation – Year 7/Year 9

Figure 6.26 shows the scatterplots for Year 7/ Year 9 vertical links before and after review. No omissions were necessary.

Figure 6.26. Links review for Grammar and Punctuation Year 7 and Year 9.

Vertical Equating of 2016 Numeracy Tests

The quality of the 2016 numeracy vertical links was generally high.

Numeracy – Year 3/Year 5

Figure 6.27 shows the scatterplots for Year 3/ Year 5 vertical links for numeracy before and after review. Two items were omitted. Both of these had high discrimination that affected the shift in the predicted direction and both had cross-year level DIF that exceeded the criterion level.

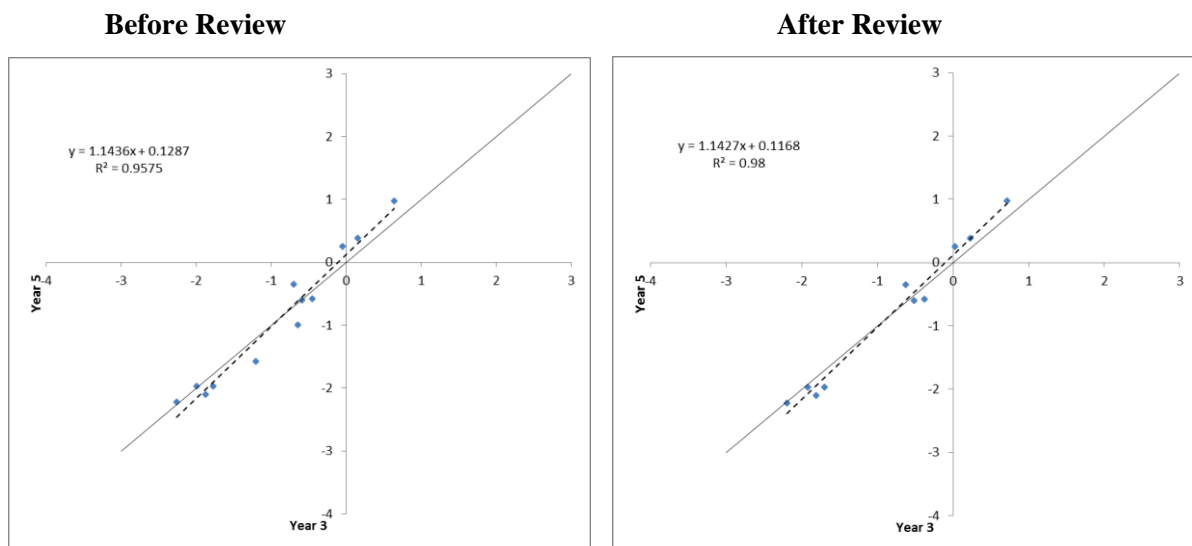

Figure 6.27. Links review for Numeracy Year 3 and Year 5

Numeracy – Year 5/Year 7

Figure 6.28 shows the scatterplot before and after review for numeracy Years 5 and 7. Three items were omitted. One r item had high discrimination that affected the shift in the predicted direction; the other two had cross-year level DIF that exceeded the criterion level.

Figure 6.28. Links review for Numeracy Year 5 and Year 7.

Numeracy – Year 7/Year 9

Figure 6.29 shows the cross year-level plot for vertical equating of the Year 7 and Year 9 numeracy tests. Nine items were omitted sequentially because the cross-year level DIF exceeded the criterion level.

Figure 6.29. Links review for Numeracy Year 7 and Year 9.

The numbers of the vertical links used and retained for each adjacent pair of year levels are shown in Table 6.2. Appendix M presents the 2016 item locations (i.e., Rasch difficulty parameters), standard errors, mean square statistics, item facilities, and item discriminations by domain for each adjacent pair of year levels.

Table 6.2. Vertical Link Review Summary

Domain	Years 3 and 5		Years 5 and 7		Years 7 and 9	
	No. Links Retained	Total No. of Links	No. Links Retained	Total No. of Links	No. Links Retained	Total No. of Links
Reading	12	14	9	13	11	12
Spelling	9	9	8	9	8	9
Grammar & Punctuation	6	8	6	9	9	9
Numeracy	10	12	10	13	13	22

Summary of Vertical Equating of NAPLAN 2016 Tests

The mean shifts between two adjacent year levels for each of the four domains are shown in Table 6.3. Year 5 is used as the reference to which other years are vertically equated as in previous administrations of the program.

Table 6.3. Vertical Shift Constants

Equating Shift	Reading	Spelling	Grammar & Punctuation	Numeracy
Year 3 to 5	-1.140	-1.689	-0.837	-1.145
Year 5 to 5	0.000	0.000	0.000	0.000
Year 7 to 5	1.140	1.810	0.731	1.118
Year 9 to 5	1.592	2.694	1.105	1.716

The final locations of the 2016 tests on each of the NAPLAN domain scales were determined by taking both of the horizontal equating results and the vertical equating results into consideration. The procedure and results are described in Section 6.4.

6.4 Comparing and Combining Results of Horizontal and Vertical Equating

The horizontal equating provides one basis for placing the 2016 NAPLAN tests on the vertical scale for each domain. The reason for this is that the four tests in each domain were vertically equated based on the vertical scale, established in 2008, through common-item vertical equating of the 2008 tests. The horizontal equating forms were first used in 2009.

It is useful to check the common-item vertical equating against the original 2008 common-item vertical equating to ascertain whether the new vertical scale is aligned with the original vertical scale. Figure 6.1 depicts the horizontal and vertical equating schematically. Each year-group can be equated directly through the horizontal equating. In principle, each year level could also be placed on the historical scale indirectly through vertical equating with the adjacent year level and horizontal equating through that adjacent year level. For example, the Year 3 NAPLAN 2016 test can be equated with the Year 5 NAPLAN 2016 test and then placed on the historical scale through the Year 5 equating form. The latter process is referred to here as *indirect* equating. The regression-based equating plots to follow indicate where there is some divergence. Ideally, any case of divergence between direct and indirect equating would be resolved to the degree possible through checking each specific component of the linking process.

The equating process that has been used in previous years of NAPLAN is designed to take into consideration both vertical equating and horizontal equating. This process was used again to establish final locations of the reading, spelling, grammar and punctuation and numeracy tests on the NAPLAN reporting scales.

In this section, the results of the horizontal equating based on the equating sample are compared with the vertical equating results based on the 2016 calibration sample for each domain. Specifically, the vertical and horizontal shift constants are plotted for each of the four year-level tests in each domain.

Figure 6.30 shows plots of the horizontal shifts for the 2016 tests (vertical axes) against the vertical shifts (horizontal axes). The latter are based on the common-item vertical equating and delta-centred at Year 5. Because each test is calibrated so that the mean item location is 0 (delta-centred),

the mean item parameters after equating will be equal to the shifts. The dotted line is the regression line based on the four tests in each domain. The regression equation and R -square are shown at the top-left corner of each plot. There is one plot per domain.

Ideally, each regression line would have a slope of 1.0 and pass through all four points, showing perfect correspondence of the two methods. It can be seen from the plots that this is not always the case. There is to some extent a re-setting of the vertical scale when the regression slopes deviate from 1.0.

Since inception of the programme, scaling factors have been employed that assume the population standard deviation remains the same over time; i.e., the scaling factors applied make the standard deviations of the population equal by definition based on the calibration sample data. The scaling factors applied to the final scale are not applied at the point of vertical or horizontal equating. Consequently, there may be differences between the locations used for reporting and the locations used for equating. The differences between the two sets of locations increase as the scaling factor increases above 1. The grammar and punctuation scaling factors have often been smaller than 1 in previous years of NAPLAN. This could reflect a greater spread of the scale due to a systematic increase in the discriminations of items on the tests.

2016 Reading Tests

2016 Spelling Tests

2016 Grammar & Punctuation Tests

2016 Numeracy Tests

Figure 6.30. Regression-based combination of vertical and horizontal equating shifts.

Table 6.4 displays the intercepts and slopes for the regression-based combination of the vertical and horizontal equating shifts.

Table 6.4. Regression Intercepts and Slopes

Regression Coefficient	Reading	Spelling	Grammar & Punctuation	Numeracy
Intercept	0.401	0.761	0.783	0.201
Slope	0.959	0.970	0.993	1.179

As in previous years, the final shifts were calculated using the regression lines of best fit

$$y = a + b \cdot x \quad (6.1)$$

where y is the final shift onto the NAPLAN scale; x is the vertical, Year-5 centred shift; b is the regression slope; and a is the regression intercept.

The final, regression-based shifts for each domain calculated using Equation 6.1 are shown in Table 6.5 by year level.

Table 6.5. Final Equating Shifts Applied for Placing NAPLAN 2016 onto the NAPLAN 2008 Scale

Year Level	Reading	Spelling	Grammar & Punctuation	Numeracy
Year 3	-0.691	-0.877	-0.049	-1.150
Year 5	0.401	0.761	0.783	0.201
Year 7	1.494	2.517	1.508	1.520
Year 9	1.927	3.374	1.880	2.225

6.5 Calibration and Scaling of Writing

Background

As noted earlier, in 2016 two writing tasks were administered as part of NAPLAN—one to Year 3 and 5 students and the other to Year 7 and 9 students. The rating of NAPLAN 2016 writing for all participating year groups was based on most of the same ten criteria and marking guide used for the writing tests in 2011 through 2015.

Raw score summary

Table 6.6 present the distributions of raw scores by year level for both calibration sample and census data, which indicate that the distributions of raw scores were very similar from 2011 to 2016.

Equating Methodology

As some background to the methodology, the following variations of tasks have been used:

- From 2008 to 2010, narrative writing tasks, single prompt
- From 2011 to 2014 persuasive tasks, single prompt
- In 2015, separate persuasive tasks for years 3 and 5 versus years 7 and 9
- In 2016, separate narrative tasks for years 3 and 5 versus years 7 and 9

Thus, in 2016 Narrative prompts were used rather than a Persuasive and there were differentiated prompts for lower year levels and higher year levels. The equating methodology comprised a two key components:

- Pairwise comparisons of 2015 and 2016 scripts to obtain, if possible, a common scale based on the comparisons
- A common person equating design in which a group of year 5 and 7 students attempted the main, differentiated task and a single secure task

The Narrative and Persuasive marking guides contain overlapping criteria but also have differences which are summarised below:

- The first three criteria differ in being genre-specific (Audience, Text Structure, Ideas)
- The fourth Narrative criterion is Character and Setting whereas the fourth Persuasive criterion is Persuasive Devices (they have an equal number of categories)
- Paragraphing has a different number of categories
- Other criteria are the same—these include Cohesion and all conventions apart from Paragraphing

In previous years, identity equating had been employed. In 2016, there was again a very high correlation between threshold locations for 2015 and 2016 calibrations and the decision taken was to anchor a set of common items.

The pairwise study design for writing in the NAPLAN 2016 assessment was essentially the same as that used in 2015. A group of 40 judges compared (i) 2015 scripts with other 2015 scripts, (ii) 2016 scripts with other 2016 scripts, and (iii) 2015 scripts with 2016 scripts. The 2015 and 2016 scripts represented performances on two differentiated tasks designed for year 3/5 and year 7/9 students. The purpose of the pairwise study was to cross-check other sources of information in the equating

Table 6.6. NAPLAN 2011 – 2016 Writing Raw Score Distribution by Year Level

Test Year	Year Level	Calibration Sample			Census Data		
		N	Mean	SD	N	Mean	SD
2011	3	1066	18.14	5.08	252901	19.42	5.12
	5	1131	23.56	5.90	258563	24.74	5.79
	7	2510	26.95	7.05	261475	28.67	6.53
	9	2401	30.31	8.10	244772	31.97	7.54
2012	3	10487	18.73	5.15	259654	19.43	4.96
	5	9644	23.70	5.71	240421	24.28	5.58
	7	20751	27.56	6.45	263986	27.72	6.36
	9	29151	30.60	7.45	253924	30.76	7.46
2013	3	10178	18.83	5.31	262679	19.43	5.25
	5	10008	23.80	5.97	258562	24.35	5.68
	7	19321	27.53	6.64	261373	27.60	6.45
	9	30230	30.69	7.61	254470	30.76	7.66
2014	3	10709	18.23	5.16	274335	18.41	5.24
	5	10337	23.52	5.54	263872	23.57	5.59
	7	19038	27.18	6.24	242127	27.16	6.37
	9	28305	30.67	7.04	255770	30.47	7.50
2015	3	11399	18.86	5.00	285722	19.46	5.03
	5	10671	23.91	5.53	267506	24.36	5.34
	7	26411	27.01	6.34	258921	27.12	6.44
	9	28348	26.07	6.38	253216	30.18	7.48
2016	3	11570	18.94	4.63	292494	19.46	4.57
	5	10879	23.19	5.02	279513	23.54	4.90
	7	27197	26.69	5.72	264959	26.62	5.83
	9	26360	29.50	6.54	235206	29.36	6.74

of Writing. The design allows evaluation of whether, for a given scale location based on pairwise comparisons, a similar rubric score was predicted for 2015 and 2016 scripts.

An additional common task was administered to all participating year levels in case it was necessary to detect interactions between task and rater effects in 2016. Specifically, approximately 800 students in total from Years 5 and 7 produced writing based on both: (i) the main 2016 tasks specific to each year level; and (ii) the secure task. Rubric scores were available for both tasks for the common persons. Pairwise locations were also available for a subset of 43 Year 5 and 56 Year 7 students that attempted both the secure and main tasks.

Pairwise Study

The purpose of the pairwise study is to obtain a common frame of reference by which to compare marking in 2015 with marking in 2016. One focus is whether there is a different relationship between the correspondence in 2016 and 2015 using differentiated prompts relative to previous years, where there was only one prompt. Another focus is whether there is any indication of a change in marker behaviour, including but not limited to harshness.

For the Pairwise study total, approximately 250 scripts from 2015 were compared with other scripts and 250 scripts from 2016 were compared with other scripts. As in the previous two years of the program, markers judged each comparison with respect to two criteria, referred to as Authorial Choices and Conventions.

Figure 6.31 shows the plot of pairwise scale locations (x -axis) against locations based on the rubrics (y -axis) for 2015 and 2016 separately. The correlation overall is approximately $r = 0.926$ for 2015 scripts and $r = 0.940$ for 2016 scripts. The pairwise scale locations show the ordering of the scripts based on direct comparisons whereas the NAPLAN scale locations are based on marking. In the plot, persuasive writing 2015 and writing 2016 are highlighted separately. The rubric locations for 2015 are based on the 2011 calibration, which continued to be used till 2015. The rubric locations (logits) for 2016 are based on calibration of the 2016 writing data. Regression lines are shown separately for each of these years. It can be seen that there is a similar correspondence between the pairwise and NAPLAN scale locations for 2015 and 2016 scripts. The correlation and nature of the relationship are relatively similar for both of these calendar years to the relationship in previous calendar years.

Figure 6.31. Scatterplot of the NAPLAN and pairwise scale locations.

6.7 Equating

Inspection of the data indicated subtle increases in local dependencies from 2015, but further investigation is required. Threshold locations were used in combination with information from the pairwise study to evaluate the viability of using common criterion equating. The threshold/delta locations for common criteria on the 2015 and 2016 are highly correlated and similar as shown in Figure 6.32. The correlation of the threshold locations is 0.999. However, the spread of the threshold locations for common items is somewhat smaller in 2016 than 2015 with the ratio being approximately 0.94.

Because the item parameter locations for common items were highly correlated, the decision was taken to anchor the 2016 scale on these common item locations. This decision was informed by the similarity between the 2015 and 2016 marking indicated by the pairwise comparison study. The common criteria are vocabulary, cohesion, sentence structure, punctuation, and spelling.

Common Person Study

The common person equating information was designed to ascertain whether there was a task-year level interaction to a degree that might indicate concerns for longitudinal equating for different year levels on a common scale. Participating students attempted a secure narrative prompt and secure persuasive prompt, each of which was common for year 5 and 7 students. The main narrative prompt differed for the two year levels. Table 6.34 presents the differences between the average abilities of students on the pairwise scale based on:

- Narrative main prompt compared with Persuasive secure prompt
- Narrative main prompt compared with Narrative secure prompt
- Persuasive secure prompt compared with Narrative secure prompt

The means should be the same within statistical margins of error if there is no interaction. It can be seen that the values of the differences are generally small. The analysis did not indicate statistically significant task by year-level interactions.

Table 6.7. Results of common person study of task-by-year level interaction effects

Year Level	Differences between the Mean Student Ability on Pairwise Scale								
	Narrative Main vs Persuasive Secure			Narrative Main vs Narrative Secure			Persuasive Secure vs Narrative Secure		
	N	Mean	SD	N	Mean	SD	N	Mean	SD
5	43	-0.073	2.356	43	-0.034	1.987	43	0.039	1.615
7	56	-0.174	1.626	56	0.050	2.338	56	0.225	1.592
Overall	99	-0.130	1.966	99	0.014	2.182	99	0.144	1.596

6.7 Estimating Standard Errors of Equating

Multiple steps were involved in the equating of reading, spelling, grammar and punctuation and numeracy. A standard error was estimated for each step. The standard errors were combined on the assumption that the errors from the steps are independent.

The errors considered in the equating processes over the course of the program are shown in Figure 6.35.

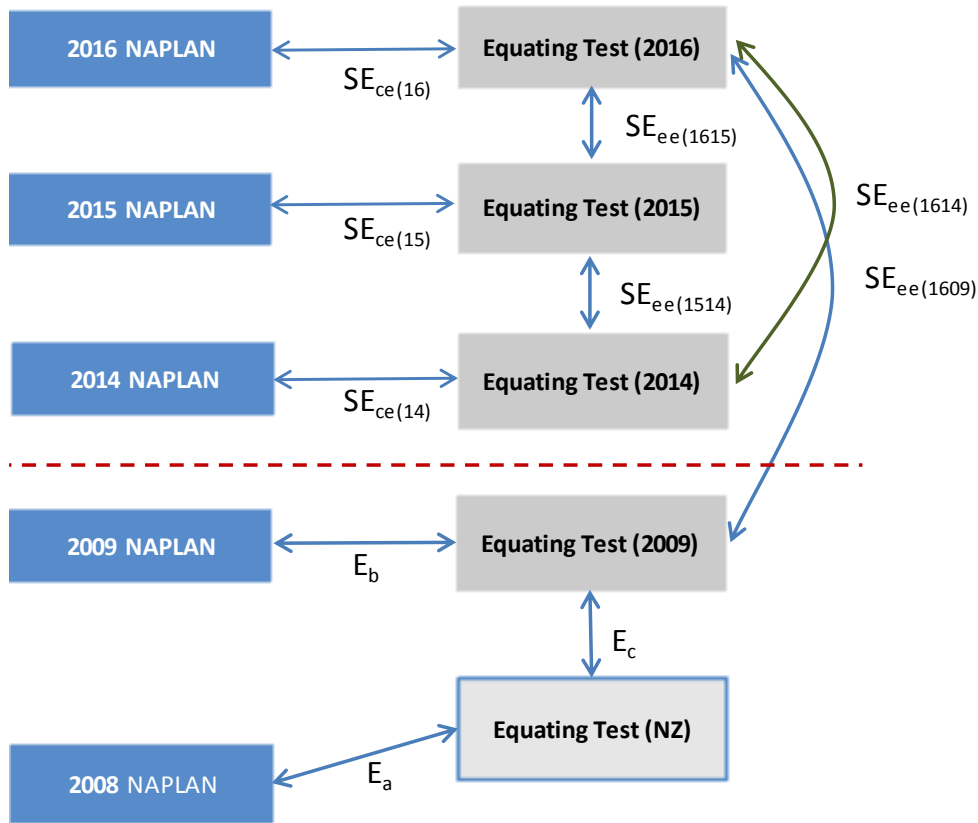

Figure 6.32. A schematic of the equating errors accumulated across NAPLAN administrations.

For each domain and year level:

- SE_a is the standard error associated with equating the offshore equating form and the 2008 NAPLAN test;
- SE_b is the standard error associated with equating the onshore equating form and the 2009 NAPLAN test;
- SE_c is the standard error associated with equating the offshore and onshore equating forms;
- $SE_{ce(15)}$ is the standard error associated with equating the NAPLAN 2015 calibration with the equating test (calibration to equating);
- $SE_{ce(16)}$ is the error associated with equating the NAPLAN 2016 calibration with the equating test; and
- $SE_{ee(1516)}$ is the standard error associated with equating the 2015 and 2016 administrations of the equating test (equating to equating); and so forth

The equating errors for equating of the 2016 scale to the 2008 scales are estimated by combining the relevant standard errors as follows:

$$SE_{2016 \rightarrow 2015} = \sqrt{SE_{ce(15)}^2 + SE_{ce(16)}^2 + SE_{ee(1615)}^2} \quad (6.7)$$

$$SE_{2016to2008} = \sqrt{SE_a^2 + SE_c^2 + SE_{ce(1609)}^2 + SE_{ce(16)}^2} \quad (6.8)$$

In 2011 it was decided to include component c of equating error, associated with the offshore testing, in equating back to 2008. The reason is that even though most items are in common with the equating form in 2009 and subsequent years, a different population of persons attempted the items in the offshore equating exercise. Component c was included again in 2016. Table 6.7 shows the standard errors of equating associated with each test domain and year level in logits.

Table 6.7. Standard Errors of Equating

Domain	Year Level	2016 to Base	2016 to 2015	2016 to 2014
Reading	3	0.060	0.053	0.049
	5	0.060	0.047	0.047
	7	0.050	0.039	0.034
	9	0.052	0.034	0.032
Writing	3	0.188	0.133	N/A
	5	0.188	0.133	N/A
	7	0.188	0.133	N/A
	9	0.188	0.133	N/A
Spelling	3	0.095	0.073	0.065
	5	0.103	0.056	0.064
	7	0.104	0.051	0.056
	9	0.101	0.069	0.061
Grammar and Punctuation	3	0.086	0.064	0.061
	5	0.098	0.045	0.050
	7	0.092	0.043	0.045
	9	0.082	0.046	0.061
Numeracy	3	0.076	0.053	0.052
	5	0.073	0.044	0.038
	7	0.052	0.030	0.032
	9	0.054	0.034	0.034

*The base year for Grammar and Punctuation, Numeracy, Reading and Spelling was 2008; the base year used for the 2016 writing scale was persuasive writing for 2011.

**The Writing equating error was calculated based on the pairwise equating data in a manner consistent with keeping the item parameters constant.

The equating errors are taken into account, together with sampling and measurement errors, in estimating the standard errors used to determine statistical significance in the comparisons between mean scores across years in NAPLAN reports. The equating errors are not included when estimating standard errors of estimates used to determine statistical significance in the comparisons between mean scores of different subgroups on NAPLAN 2016. In estimating standard errors for percentages at or above minimum standards, the equating errors were applied to the cut-points for proficiency bands.

The equating errors are taken into account, together with sampling and measurement errors, in estimating the standard errors used to determine statistical significance in the comparisons between mean scores across years in NAPLAN reports. In estimating standard errors for percentages at or above minimum standards, the equating errors were applied to the cut-points for proficiency bands.

CHAPTER 7. REPORTING OF NAPLAN PERFORMANCE IN 2016

NAPLAN 2016 achievement scores for reading, numeracy, spelling and grammar and punctuation were reported on the NAPLAN vertical scales as they were for NAPLAN administrations 2008 through 2015. This was made possible by applying the equating shifts and scale transformations necessary to bring the 2016 logit scores for each test in each domain onto the NAPLAN reporting scale. The NAPLAN 2016 achievement scores in writing were produced by forming a single scale that placed the genre used in 2016, narrative writing, on the same scale as persuasive writing based on common writing traits. The details of both of these processes are reported in previous chapters

As in previous years, student results were reported against proficiency bands. The cut-points for proficiency bands established for NAPLAN 2008 reporting were used for NAPLAN 2016. The scale equating enabled achievement scores to be compared across NAPLAN administration years for reading, numeracy, spelling and grammar and punctuation, and across the 2011 through 2016 administrations for writing.

7.1 Proficiency Estimates

As for the previous years, population statistics for the reporting of NAPLAN 2016 achievement at the state/territory and national levels were estimated using the technique of *plausible values*. In this approach, student achievement is not estimated as a single value or point estimate such as one would do using weighted likelihood estimates (WLEs). Instead, a range of values – called the posterior distribution – is estimated for each student's achievement. The plausible values represent a random selection from this distribution that is conditional on the student's observed item responses and their background variable values.

As Wu (2004) notes:

As plausible values are random draws from a student's posterior distribution, plausible values are not appropriate to be used as individual student scores for reporting back to the students. Suppose two students have the same raw score on a test, their plausible values are likely to be different as these are random draws from the posterior distribution. Imagine the outcry if we ever give two students different ability scores when they have the same raw score. However, plausible values are used to estimate population characteristics, and they do a better job than a set of point estimates of abilities. (p. 976)

Using plausible value methodology to obtain proficiency estimates for populations and subpopulations is a standard approach in large scale national assessment programs, as well as in international assessment programs such as the Programme for International Student Assessment (PISA). An introduction to the conceptual basis of plausible values and calculations involving them in the context of PISA is described in a report from the Organisation for Economic Co-operation and Development (OECD, 2009).

Five plausible values were drawn for each student in each domain using *ACER ConQuest*. The plausible values for reading, spelling, grammar and punctuation and numeracy were drawn concurrently, based on a multidimensional item response model with latent regression (Wu, et al, 2007). In drawing the plausible values, conditioning variables were used as regressors for the model. The variables used in 2015 were also used in 2016. The categorical variables used in the model were gender, LBOTE status, Indigenous status, parental education, parental occupation, school geolocation and school sector, and the continuous variable was a measure of average school

ability, specifically the school reading WLE average score. A diagrammatic representation of the model is shown in Figure 7.1.

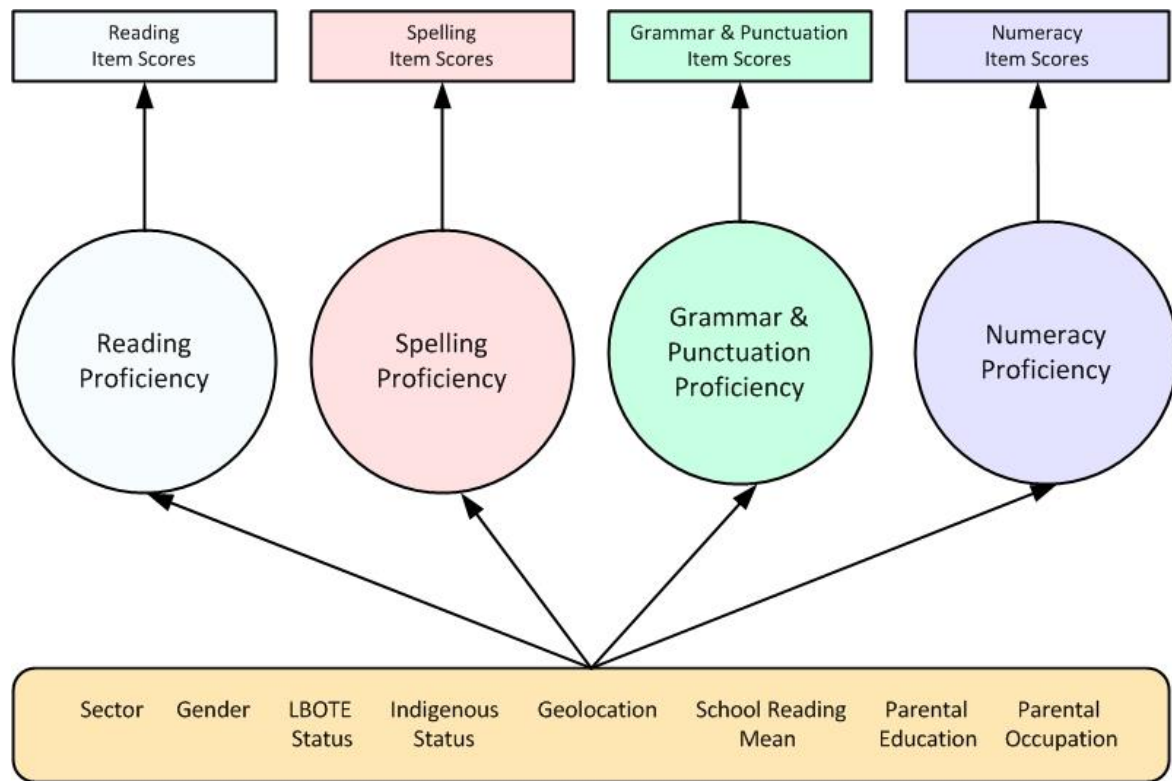

Figure 7.1. Conditioning variables for the multidimensional item response model with latent regression.

The categorical variables were included in the model using what are referred to as *indicator variables*. In this approach, a single categorical variable is recoded by multiple indicator variables that are coded with a “1” to denote the presence of a category level, and a “0” to denote the absence of the category level. In general, it takes $k - 1$ indicator variables to recode k category levels. For example, the variable gender was designated as having three categories, namely, *male*, *female*, and *missing*. The categories of gender were recoded for each student using one indicator variable to denote *female*, and a second indicator variable to denote *missing*. If the pair of indicator variables had the values 1 and 0 respectively, this meant that the gender category for the student was *female*; when the indicator variables had the values of 0 and 1, then the gender category was *missing*. When both indicators were 0, this indicated that the gender category for the student was *male*. In a similar fashion, this approach was applied to the other categorical variables used in the model.

Due to differences between states/territories with respect to the distributions of students across these variables, some categories of these conditioning variables may not have been observed or may have been perfectly correlated with other conditioning variables. For example, during one NAPLAN administration, in year level 3, the indicator for school geolocation indicating whether this information was missing was perfectly correlated with school sector indicator for home-schooled students. In these cases, categories of conditioning variables were combined or conditioning variables were removed from the generation of plausible values for the state/territory in question. The specific set of regression indicators used for each year level and jurisdiction in 2016 is presented in Appendix M.

The plausible values were drawn separately for each jurisdiction to allow for the possibility of different relationships between proficiency estimates and conditioning variables across the jurisdictions. Plausible values were drawn for all students, including absent students, students that had withdrawn from taking the test, and students who were exempt from taking the test.

The plausible values for writing were drawn in a separate calibration for each state/territory. In this calibration, school sector, gender, LBOTE status, Indigenous status, parental education, parent occupation, school geolocation, year level and the school writing WLE average score were included as conditioning variables. To calculate school writing WLE average score, each student's WLE was first obtained by running ConQuest program on a full census writing data. At this step, items were fixed with 2011 writing item parameters, and grade was set as predictor. After this, the full census data was divided into each grade, and only the WLEs of students who participated in writing test were used to calculate means of school and TAA by a test participation flag (i.e., $\text{test_writing} = P$) available from 2016 calibration data dictionary. If a student missed the test, his/her school WLE average score was the mean of the school that he/she attended. However, if a school did not have any student who participated in the writing test, then school WLE average score of those students is the mean of the TAA to which the school belonged.

The five sets of plausible values, one set for each content domain, were used to calculate means, standard deviations, percentiles and percentages of students within proficiency bands, for each domain and each year level at the jurisdictional and national level. The statistics were calculated for the full population of students and by selected background variables, such as gender, and included only the absent students and the students that had withdrawn from taking the test. The plausible values were also used to obtain estimations of measurement errors.

Estimates of sampling and measurement errors were combined to obtain final standard errors for the performance statistics reported for the census data. The standard errors were used to determine statistical significance of mean differences and percentage differences in NAPLAN 2016 performance in the reports. Relevant equating errors were taken into consideration, in addition to sampling and measurement errors, to estimate standard errors and evaluate statistical significance of mean and percentage differences between 2016 and 2015 as well as 2016 and 2008 for reading, numeracy, spelling, and grammar and punctuation and between 2016 and 2015 as well as 2016 and 2011 for writing.

7.2 Reporting NAPLAN 2016 Student Achievement on NAPLAN Reporting Scales

The plausible values were drawn on the delta-centred scale for each test. Before the scaling was finalised, the 2016 latent distributions of student achievement were estimated using the plausible values drawn for the 2016 calibration sample, with the student weights applied. The means and standard deviations calculated from the sample provided estimates of the population latent distributions before the full cohort data were available.

The standard deviations obtained for 2016 were then compared to the population standard deviations for what were referred to as each domain's *base year*. For the standard deviations for the reading, numeracy, spelling and grammar and punctuation domains, the base year chosen was 2009, while for writing, it was 2011. The ratio of the base year standard deviation to the 2016 standard deviation was calculated for each domain at each year level. A ratio that was greater than 1.0 indicated that the base year test spread the students out more than the 2016 test did for that domain at the particular year level. Conversely, a ratio that was less than 1.0 indicated that the 2016 test spread the students out more than the base year test for that domain at that particular year level.

These ratios of standard deviations were then used as scaling factors to correct for the different standard deviations.

For each domain at each year level, a linear transformation was applied to scores on the delta-centred logit scale to correct for the spread in the scores and to apply the appropriate equating constant to put the scores onto the NAPLAN vertical domain logit scale. The scaling factor was applied for each domain at each year level, with the estimated population mean as the centre of transformation.

For each domain at each year level, a logit score was transformed as follows:

$$\textit{TransformedLogitScore} = SF \cdot (\textit{LogitScore} - \textit{LocalMean}) + \textit{LocalMean} + \textit{EqShift} \quad (7.1)$$

where

LocalMean = the mean of the latent distribution estimated using the 2016 calibration sample based on the delta-centred item parameters,

SF = the scale factor that was calculated from the ratio of the base year standard deviation to the 2016 standard deviation.

EqShift = the equating constant pertinent for the domain at the particular year level.

The values for *LocalMean*, *SF*, and *EqShift* are presented in Table 7.1 for each year level by domain.

The same transformation was applied to the WLE ability logit scores in the score equivalence table, the item parameters and the plausible values. For writing, the scaling factor and equating shifts were set to one and zero, respectively, in Table 7.1.

For each domain, estimates in logits were transformed to the NAPLAN reporting scale scores established in NAPLAN 2008 as follows:

$$\textit{NAPLANScaleScore} = 100 \cdot (\textit{Score}_{\textit{logit}} - \textit{DomainMean}) / (\textit{DomainStdDeviation}) + 500 \quad (7.2)$$

where *DomainMean* and *DomainStdDeviation* are the estimated overall domain mean and overall domain standard deviation calculated using the 2008 calibration sample. These are presented in Table 7.2.

It should be noted that for each domain, the standard error (SE) in logits associated with each WLE estimate was transformed to the NAPLAN scale metric as follows:

$$SE_{\textit{NAPLANScale}} = 100 \cdot \frac{SE_{\textit{logit}}}{\textit{DomainStdDeviation}} \quad (7.3)$$

Table 7.1. Parameters for transforming the 2016 logit scores to the NAPLAN Scales

Year	Domain	Local Mean	Scaling Factor	Equating Shift
Year 3	Reading	0.7329	0.9943	-0.6915
	Writing	—*	1	0
	Spelling	-0.3473	1.1307	-0.8767
	Grammar and Punctuation	0.4312	1.1443	-0.0486
	Numeracy	0.3251	1.2033	-1.1496
Year 5	Reading	0.7687	1.2119	0.4011
	Writing	—*	1	0
	Spelling	-0.0506	0.9713	0.7615
	Grammar and Punctuation	0.5256	1.1722	0.7828
	Numeracy	0.4707	0.9331	0.2010
Year 7	Reading	0.3292	1.135	1.4943

*Not applicable.

Table 7.2. Domain Mean and Standard Deviation for Transforming Logits to NAPLAN Scale Scores

Domain	Domain Mean	Domain SD
Reading	1.1629	1.4867
Writing	1.1160	3.3679
Spelling	0.9406	2.6241
Grammar and Punctuation	1.2529	1.3605
Numeracy	0.8102	1.6652

7.3 Score Equivalence Tables

To facilitate rapid generation of student and school reports, score equivalence tables for converting raw scores to weighted likelihood estimates (WLEs) and their corresponding NAPLAN scale scores were generated for each test and provided to the jurisdictions' Test Administration Authorities. The equivalence tables enable the TAAs to locate individual students on NAPLAN reporting scales using the raw scores for each test. The NAPLAN 2016 score equivalence tables are presented in Appendix K. The tables show the scores and the associated standard errors in logits and in

NAPLAN scale scores. For Year 7 and Year 9 numeracy, three separate tables were provided. The first was for the overall numeracy test, the second for the non-calculator form and the third for the calculator form. The second and third tables were for allocating scores to students who sat only one of the forms.

The preliminary national mean, the 20th percentile score and the 80th percentile score (to give the approximate range of the middle 60 percent) based on the calibration sample were provided for each domain and year level for reporting to schools and parents.

7.4 Reporting against Proficiency Bands

As in previous NAPLAN administrations, student achievement was also reported against proficiency bands for each domain. The ten proficiency bands on the NAPLAN reporting scales had the cut-points set at equal intervals apart. Year 3 results were reported against Band 1 to Band 6, Year 5 results reported against Band 3 to Band 8, Year 7 results reported against Band 4 to Band 9, and Year 9 results reported against Band 5 to Band 10. The cut-points for the proficiency bands were developed in 2008 and used in reporting the NAPLAN 2016 results.

As the vertical scale for each domain is standardised, the scales for all the domains are very similar in length. Each scale has the same number of proficiency bands and the same nine cut-points on the transformed scales. The performance distribution at each year level could span approximately six bands. A student whose proficiency fell within a specific band would be expected to score at least 50% correct on a test made up of items that fell into that band.

The cut scores separating the proficiency bands are presented in Table 7.3. The cut scores are different on the logit scales for the domains but are the same on the transformed NAPLAN scales.

Table 7.3. Proficiency Bands Cut Scores

Band Cut Score	Scale Score	Logits				
		Reading	Writing	Spelling	Grammar and Punctuation	Numeracy
9/10	686	3.928	7.380	5.821	3.783	3.907
8/9	634	3.155	5.629	4.457	3.076	3.042
7/8	582	2.382	3.878	3.092	2.369	2.176
6/7	530	1.609	2.126	1.728	1.661	1.310
5/6	478	0.836	0.375	0.363	0.954	0.444
4/5	426	0.063	-1.376	-1.001	0.246	-0.422
3/4	374	-0.710	-3.128	-2.366	-0.461	-1.288
2/3	322	-1.483	-4.879	-3.730	-1.169	-2.154
1/2	270	-2.257	-6.630	-5.095	-1.876	-3.020

Figure 7.2 depicts how student results are reported against the proficiency bands. Results in each year level are reported against six bands. For Year 3, scores above Band 6 are reported against Band 6. For Year 5, scores above Band 8 are reported against Band 8 and scores below Band 3 are reported against Band 3. For Year 7, scores above Band 9 are reported against Band 9 and scores

below Band 4 are reported against Band 4. For Year 9, scores below Band 5 are reported against Band 5.

The yellow band for each year level in Figure 7.2 is identified as the national minimum standard for that year level. Band 2 is the national minimum standard for Year 3, Band 4 for Year 5, Band 5 for Year 7 and Band 6 for Year 9. Students are deemed to have performed above national minimum standard if their scores fall in the green bands at their respective year level and below national minimum standard if their scores fall in the orange band.

Band	Year 3	Year 5	Year 7	Year 9
10				Green
9			Green	Green
8		Green	Green	Green
7		Green	Green	Green
6	Green	Green	Green	Yellow
5	Green	Green	Yellow	Orange
4	Green	Yellow	Orange	
3	Green	Orange		
2	Yellow			
1	Orange			

Figure 7.2. Reporting against the NAPLAN proficiency bands.

7.5 National Reports

The NAPLAN 2016 Summary Information was released on 3 August 2016. The summary information provides results in each domain at each year level and by state/territory and nationally. This information was released around the same time that student reports were distributed to parents. The National Report includes subgroup results by gender, language background, Indigenous status, geolocation, parental education and parental occupation. The National Report was released on 9 December 2016.

APPENDIX A. NAPLAN EQUATING AND CALIBRATION SAMPLES 2016

PREPARED FOR:

AUSTRALIAN CURRICULUM, ASSESSMENT AND REPORTING AUTHORITY

APRIL 2016

Mark Dulhunty

Leanne Calvitto

Purpose

The purpose of this report is to provide information regarding the 2016 NAPLAN Calibration and Equating Samples that complements existing NAPLAN technical documentation. It should be read in conjunction with the NAPLAN 2016 Calibration Sample Weighting.pdf.

Sample frame

Primary and Secondary samples

The NAPLAN Calibration and Equating Samples each consist of two sub-samples. For the Calibration Sample, one sample was drawn for the Primary year levels and the other sample for the Secondary year levels. This same procedure was also followed for the NAPLAN Equating Sample. Figure 1 illustrates the relationship between NAPLAN Year Levels, State/Territory and Primary and Secondary Schooling.

Year 7 has been treated as a secondary year level for QLD and WA since 2015. SA was the only state where Year 7 was included as a primary year level.

State/Territory	Year 3	Year 5	Year 7	Year 9
ACT	Primary		Secondary	
NSW				
NT				
TAS				
VIC				
QLD				
WA				
SA	Primary		Secondary	

Figure 1: Relationship between state/territory, NAPLAN year levels and Primary/Secondary Schooling.

For each sampled school, all students in the target year levels were included in the calibration sample. For the Primary sample, this consisted of Year 3 and Year 5 students in all states and territories as well as Year 7 students in SA (see Figure 1). In relation to the Secondary sample, the target year levels were Year 7 and Year 9 except for SA whose target year levels consisted of Year 9 students only.

Source data

ACARA provided a list of Australian schools which included the number of students enrolled at each school in Years 3, 5, 7 and 9 in 2015. Additional demographic information such as state, sector, geographic location and aggregate NAPLAN performance data was also provided.

Measures of enrolment size

The measure of enrolment size for a particular year level was taken to be the enrolment size in the equivalent year level for the calendar year prior. That is, the 2015 enrolment numbers contained in the source data were used to estimate 2016 enrolment sizes. For example, Year 3 enrolment sizes in the 2015 source data were used as the estimate for 2016 Year 3 enrolment sizes.

A change to school starting age in QLD meant that the enrolment numbers for Year 9 students in 2016 are lower than usual (41,000 instead of a typical cohort size of approximately 59,000 students). To accommodate this, the QLD Grade 8 enrolments from the sample frame (which is

based on 2015 enrolments) were used to estimate the 2016 Year 9 enrolments for QLD. Calibration sample frames

Calibration sample frames

The calibration sample frame consisted of 7476 schools with Primary year levels and 2643 schools with Secondary year levels. Very remote schools in WA and NSW (89 schools in total) were excluded from the sample frame prior to sample selection.

Equating sample frames

The equating sample frame comprised 3786 primary schools and 1757 secondary schools. Schools that were in the equating sample in 2014 or 2015 were excluded from selection, as were all remote and very remote schools in each state/territory. Schools were also excluded if the enrolment was less than the desired target cluster size of 25 students for Primary year levels and 20 students for Secondary year levels. Sampled schools were then assigned to one of three assessment domains (Reading, Language Conventions or Numeracy).¹

Sampling methodology

Once sample frames had been created, four samples were drawn: Calibration Primary, Calibration Secondary, Equating Primary and Equating Secondary.

The same general methodology was applied to select schools for each of the four samples. Firstly, this involved explicit and implicit stratification of sample frames. Schools were then selected for inclusion in the sample using random start systematic sampling where schools within each explicit stratum had an equal probability of selection.

Explicit stratification

For the calibration sample, sample frames were split into 24 explicit strata with each stratum containing a particular state/territory (n=8) and sector (n=3).

For the equating sample, sample frames were split into 18 explicit strata where ACT, NT and TAS were 3 strata while the remaining states (n=5) were split by sector (n=3) into the remaining 15 explicit strata.

Implicit stratification

Within each explicit stratum, schools were implicitly stratified by the variables detailed in Table 1.

¹ The equating sample does not include the Writing domain.

Table 1: Implicit stratification variables

Implicit Stratification Variable	Description
Sector	School sector (Catholic, Government, Independent)
SchtypeID	An indicator denoting the inclusion (or absence of) year 7 students in the sample.
Geolocation	Geographic location as provided by ACARA
NAPLAN performance	For each school, a numeric value was provided by ACARA representing performance on NAPLAN across all year levels and domains at the school.
MeanENR	Average of student enrolments across the target year levels within each school.

Further information relating to each implicit stratification variable has been provided below.

Sector

Sector was included as an implicit stratification variable in the instances it wasn't used as an explicit stratification variable.

SchtypeID

SchtypeID was named PriSchtype for primary samples and SecSchtype for secondary samples. The coding scheme used here was consistent with 2012 procedures.

PriSchtype was set to 1 if the primary school had only year 7 students enrolled and no year 3 or 5 students (by definition this only occurs in SA). Set equal to 2 for all other primary schools.

SecSchtype was set to 1 if the secondary school had no year 7 students but had more than five year 9 students (by definition this can only occur in states other than SA). Set equal to 2 for all other secondary schools.

Geolocation

1 = Major Cities of Australia, 2=Inner Regional Australia, 3=Outer Regional Australia, 4=Remote Australia

NAPLAN performance

Within each state and territory NAPLAN performance values were condensed into five levels with approximately equal numbers of schools in each level within the state. The percentile scores used to create the performance levels within each state are included in Table 2.

For example, level 5 represents schools with NAPLAN performance values that ranked them above the 80th percentile of other schools in the same state/territory (e.g. in ACT this was schools with values higher than 0.343, in SA this was schools with values higher than 0.107). Level 4 denotes schools with a rank in their state/territory above the 60th percentile but less than or equal to the 80th percentile (e.g. in Victoria level 4 indicated that the school had a NAPLAN performance value above 0.128 but equal to or less than 0.359).

Table 2: NAPLAN performance value cut-points for percentile groups

State/Territory	Percentiles (within state)			
	20	40	60	80
ACT	-0.259	0.022	0.164	0.343
NSW	-0.451	-0.171	0.074	0.349
NT	-2.537	-2.113	-1.033	-0.444
QLD	-0.538	-0.268	-0.072	0.15
SA	-0.543	-0.295	-0.104	0.107
TAS	-0.552	-0.341	-0.14	0.096
VIC	-0.293	-0.071	0.128	0.359
WA	-0.598	-0.293	-0.044	0.239

MeanENR

For the Primary and Secondary samples, the average enrolment size was estimated by taking the mean of enrolments for each target year level where the enrolment size was greater than zero. For example, the Primary enrolment size for a school in SA was equal to the average enrolment across Years 3, 5 and 7 while for the other states/territories it is equal to the average enrolment across Years 3 and 5. In cases where there were no students in Year 5 for example, then the average was calculated using Years 3 students only (or Year 3 and Year 7 for SA schools). The definition of ‘no students’ in a year level was when the sample frame contained an enrolment total that was either zero or missing. It appears that zero may sometimes be used to indicate that a school does not cater for a particular year level while for other schools (especially small schools) zero may indicate that there are simply no enrolments for students in a particular year level for a given calendar year. The implication being that the mean ENR may be slightly overestimated for some small schools.

Selecting schools

Within each explicit stratum schools were selected with equal probability. Further explanation of the steps used, including relevant sampling parameters, are detailed in Appendix B.

Selected schools

As shown in **Error! Not a valid bookmark self-reference.**, the calibration sample comprised of 309 schools at the primary level and 300 schools at the secondary level. For the equating sample, 109 schools were selected at the primary level while there were 138 schools in the secondary equating sample.

Table 3: Number of selected schools in each state and sample

	Calibration Sample		Equating Sample	
	Primary	Secondary	Primary	Secondary
ACT	20	17	6	6
NSW	48	48	31	40
NT	25	17	6	2
QLD	48	48	17	26
SA	45	46	8	12
TAS	30	30	6	6
VIC	48	48	24	31
WA	45	46	11	15
Total	309	300	109	138

Replacement schools

Up to two replacement schools were also selected for each sample school. The overall numbers of replacement1 and replacement2 schools were close to, but slightly less than the number of selected schools (as shown in **Error! Not a valid bookmark self-reference.**). In some cases, particularly in smaller states/territories, it was not possible to select any replacement schools. In some cases only one replacement school could be selected. Selection of replacement schools are consistent with those used in PISA (OECD 2012 p67)².

Table 4: Number of selected and replacement schools

Sample type	selected	replacement1	replacement2	Total
Calibration Primary	309	309	309	927
Calibration Secondary	300	297	272	869
Equating Primary	109	109	108	326
Equating Secondary	138	136	136	410

Expected sample sizes

The expected number of students included in the calibration sample is equivalent to the sum of all enrolments at the target year levels for selected schools. The expected calibration sample sizes for 2016 are shown in **Error! Not a valid bookmark self-reference.**. For example, approximately 12000 students are expected to be included in the calibration sample for Year 3 while 30000 students are expected to be included at Year 9. Secondary schools, in general, have higher enrolment numbers per school than primary schools and hence more secondary school students are expected for inclusion in the sample given the number of schools selected at each level (primary and secondary) is approximately equal. The total expected sample size of approximately 28500 students for Year 7 is comprised of students drawn from both the primary and secondary calibration samples.

² OECD (2012), *PISA 2009 Technical Report*, PISA, OECD Publishing.
<http://dx.doi.org/10.1787/9789264167872-en>

Table 5: Expected calibration sample sizes by year level

Year	Sum ENR
Year 3	12004
Year 5	11109
Year 7 ³	28473
Year 9	30042

For the equating sample, an indication of the likely number of students included in the sample was estimated by multiplying the number of schools by the target cluster size for each year level. These figures assume 25 students per class for the primary sample and 20 students per class for the secondary sample. As shown in **Error! Not a valid bookmark self-reference.**, approximately 2700 students are sampled at each year level across the 3 domains. Year 7 is comprised of 8 SA schools from the primary equating sample (12 each domain with target cluster size of 25 students) and 87 schools from the secondary equating sample (29 each domain with target cluster size of 20 students).

Table 6: Expected equating sample sizes by year level

Year	Number of schools	Expected total sample size (R and LC and N)	Expected sample size per domain
Year 3	109	2725	908
Year 5	109	2725	908
Year 7 ⁴	134	2720	907
Year 9	138	2760	920

Table 7 contains the number of schools included in the equating sample for each year level and domain.

Table 7: Equating sample number of schools by domain and year level

Year	R	LC	N
Year 3	36	37	36
Year 5	36	37	36
Year 7 ⁵	44	45	45
Year 9	46	46	46

3 Comprising 1379 Year 7 students from the primary calibration sample and 27094 students from the secondary calibration sample.

4 Comprising 8 primary schools with Year 7 students (target cluster size of 25) and 126 secondary schools with Year 7 students (target cluster size 20).

5 Comprising 2 R, 3 LC and 3 N primary schools and 42 R, 42 LC and 42 N secondary schools.

Appendix A

Sample Frame

Summary

Overall, the ACARA supplied sample frame information corresponds well to ABS totals for the target year levels suggesting that the supplied data is suitable for use as the NAPLAN sample frame.

Original data

The original sample frame provided by ACARA contains 2015 information. The number of schools per state/territory is shown in **Error! Not a valid bookmark self-reference.** compared to ABS 2015 totals.

Table 8 Number of schools per state/territory

State/territory	ABS All (2015 ⁶)	ACARA Sample Frame ⁷	% Comparison
ACT	126	118	107%
NSW	2917	2862	102%
NT	183	176	104%
QLD	1654	1656	100%

VIC	2122	2235	95%
WA	1007	896	112%
Aus	8956	8893	101%

⁶ Data sourced from the Australian Bureau of Statistics 2015, "[Table 35a Summary of School Characteristics, 2015](#)", cat. no. 4221.0, ABS, Canberra. Released 18/03/2016. ABS totals are based on Primary + Secondary + Combined only and do not include special schools.

⁷ The totals in this table are based on the original file from ACARA after approximately 1158 schools were removed. 962 schools were deemed 'Not Eligible' as they had participated in a previous equating study, were a special school or a distance school, or the school had requested to be removed. Additionally, 67 schools had incomplete NAPLAN data (either student count or NAPLAN aggregate missing) and 6 schools had missing geolocation codes causing them to be removed from the sample frame. Lastly, 89 very remote WA and NSW schools and 34 schools with zero enrolments in all of the target year levels (i.e. no enrolments in any of Years 3, 5, 7 or 9) were removed.

Table 9 contains enrolment totals by year level and state/territory while Table 10 contains corresponding ABS totals.

Appendix B

Sampling parameters

The sampling parameters used to draw the sample are provided in **Error! Not a valid bookmark self-reference.** . These can be used in conjunction with the sample frame to replicate selection of the samples. An explanation of the sample parameter variables is included in Table 11.

To select schools within each explicit sample frame, the selected schools are those whose row numbers within the sample frame belong to the set of integers produced by the following algorithm:

for each integer (i) in the range (0 to units) inclusive,

select the school if the row number for the school in the sample frame is equal to

$[(i + RN) \times interval]$ rounded to the nearest integer

Table 11: Sample parameters glossary

Sample strataID	One of the 4 samples drawn: CP=Calibration Primary; CS=Calibration Secondary; EP=Equating Primary; ES=Equating Secondary Explicit strata id
State	state/territory
Sector	C=Catholic; G=Gov; I=Indep, A=All sectors.
cases	Number of schools in sample frame
units	Number of schools sampled (desired)
interval	sampling interval which is equal to cases / units
RN	random number between 0 and 1
inclprob	school inclusion probability (each school within an explicit stratum has the same inclusion probability) = units/cases
designweight	inverse of inclprob
Nsel	Number of schools sampled
Nr1	Number of 1st replacement schools
Nr2	Number of 2nd replacement schools

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.
In this analysis 1.93% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

```

N                5287
Mean              23.59
Standard Deviation  7.89
Variance          62.32
Skewness          -0.41
Kurtosis          -0.68
Standard error of mean  0.11
Standard error of measurement  2.54
Coefficient Alpha   0.90

```

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.
In this analysis 0.83% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

```

N 6304
Mean 27.29
Standard Deviation 8.62
Variance 74.39
Skewness 0.02
Kurtosis -0.59
Standard error of mean 0.11
Standard error of measurement 3.10
Coefficient Alpha 0.87

```

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.
In this analysis 0.82% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

```

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.
In this analysis 2.10% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	6283
Mean	13.09
Standard Deviation	7.02
Variance	49.22
Skewness	0.18
Kurtosis	-0.73
Standard error of mean	0.09
Standard error of measurement	2.02
Coefficient Alpha	0.92

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.
In this analysis 3.13% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	5833
Mean	13.78
Standard Deviation	6.84
Variance	46.83
Skewness	0.05
Kurtosis	-0.66
Standard error of mean	0.09
Standard error of measurement	2.13
Coefficient Alpha	0.90

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.
In this analysis 3.00% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

```

N 5285
Mean 14.77
Standard Deviation 5.10
Variance 25.98
Skewness -0.02
Kurtosis -0.62
Standard error of mean 0.07
Standard error of measurement 2.32
Coefficient Alpha 0.79

```

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.
In this analysis 1.38% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

```

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.
In this analysis 0.90% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	6284
Mean	15.38
Standard Deviation	5.03
Variance	25.28
Skewness	0.06
Kurtosis	-0.56
Standard error of mean	0.06
Standard error of measurement	2.35
Coefficient Alpha	0.78

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.
In this analysis 0.57% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	5839
Mean	15.59
Standard Deviation	4.84
Variance	23.43
Skewness	0.04
Kurtosis	-0.43
Standard error of mean	0.06
Standard error of measurement	2.24
Coefficient Alpha	0.79

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.
In this analysis 0.84% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

```

N                5291
Mean             19.23
Standard Deviation 6.16
Variance        37.92
Skewness        0.05
Kurtosis        -0.58
Standard error of mean 0.08
Standard error of measurement 2.46
Coefficient Alpha 0.84

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.
In this analysis 0.58% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

```

N 4993
Mean 23.00
Standard Deviation 7.81
Variance 61.01
Skewness -0.18
Kurtosis -0.60
Standard error of mean 0.11
Standard error of measurement 2.52
Coefficient Alpha 0.90

```

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal. In this analysis 1.16% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	6266
Mean	32.81
Standard Deviation	12.45
Variance	154.98
Skewness	0.09
Kurtosis	-0.64
Standard error of mean	0.16
Standard error of measurement	3.29
Coefficient Alpha	0.93

The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal. In this analysis 1.70% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	5756
Mean	32.26
Standard Deviation	12.25
Variance	150.15
Skewness	0.31
Kurtosis	-0.50
Standard error of mean	0.16
Standard error of measurement	3.23

=====

 The following traditional statistics are only meaningful for complete designs and when the amount of missing data is minimal.
 In this analysis 0.00% of the data are missing.

The following results are scaled to assume that a single response was provided for each item.

N	22384
Mean	24.55
Standard Deviation	6.96
Variance	48.45
Skewness	-0.04
Kurtosis	0.65
Standard error of mean	0.05
Standard error of measurement	1.60
Coefficient Alpha	0.95

APPENDIX E. VARIABLE MAPS

Figure E.1 Year 3 Reading Variable Map

NAPLAN 2016, Calibration, Grade 3, Reading

MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES

Each 'X' represents 8.0 cases

Figure E.2 Year 5 Reading Variable Map

Figure E.3 Year 7 Reading Variable Map

Figure E.5 Years 3, 5, 7 and 9 Writing Variable Map

NAPLAN 2016, Calibration, All Grades, Writing
 MAP OF WLE ESTIMATES AND THRESHOLDS

Generalised-Item Thresholds

Each 'X' represents 146.7 cases
 The labels for thresholds show the levels of item, and step, respectively

Figure E.6 Year 3 Spelling Variable Map

=====
 NAPLAN 2016, Calibration, Grade 3, Spelling
 MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES
 =====

Terms in the Model (excl Step terms)

+item

=====
 Each 'X' represents 8.6 cases
 =====

Figure E.7 Year 5 Spelling Variable Map

=====
 NAPLAN 2016, Calibration, Grade 5, Spelling
 MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES
 =====

Each 'X' represents 8.5 cases

Figure E.8 Year 7 Spelling Variable Map

=====

NAPLAN 2016, Calibration, Grade 7, Spelling

MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES

=====

Terms in the Model (excl Step terms)

Each 'X' represents 10.6 cases

Figure E.9 Year 9 Spelling Variable Map

=====

NAPLAN 2016, Calibration, Grade 9, Spelling

MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES

=====

Each 'X' represents 10.8 cases

Figure E.10 Year 3 Grammar and Punctuation Variable Map

Figure E.11 Year 5 Grammar and Punctuation Variable Map

Figure E.13 Year 9 Grammar and Punctuation Variable Map

NAPLAN 2016, Calibration, Grade 9, GP

MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES

Each 'X' represents 9.6 cases

Figure E.14 Year 3 Numeracy Variable Map

Figure E.15 Year 5 Numeracy Variable Map

=====

NAPLAN 2016, Calibration, Grade 5, Numeracy

MAP OF LATENT DISTRIBUTIONS AND RESPONSE MODEL PARAMETER ESTIMATES

=====

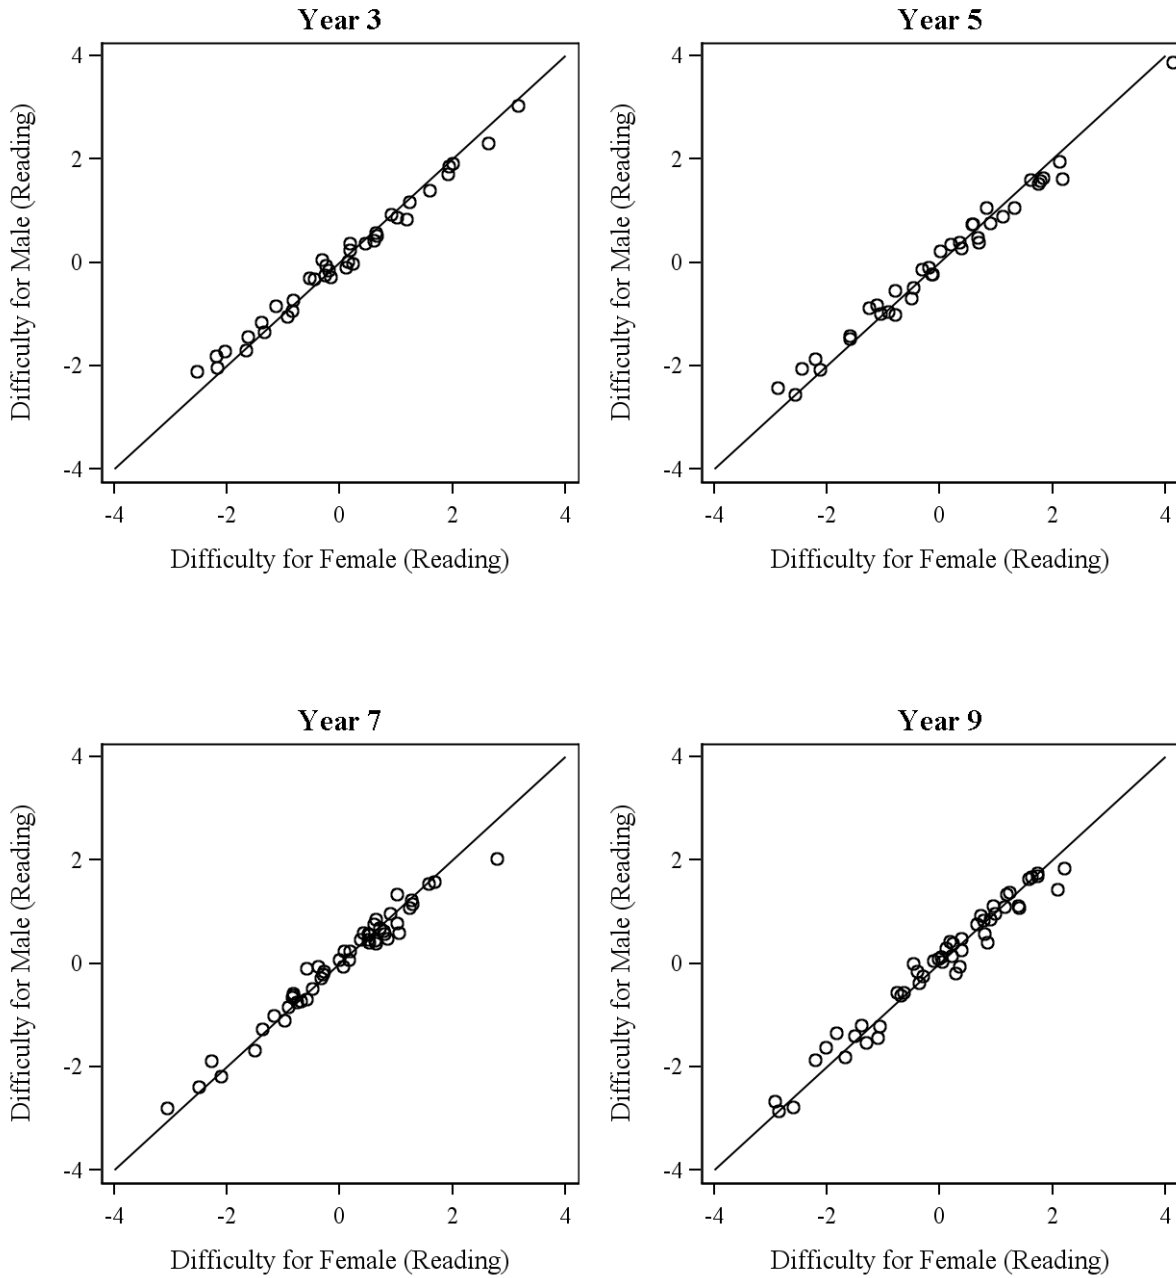

Terms in the Model (excl Step terms)

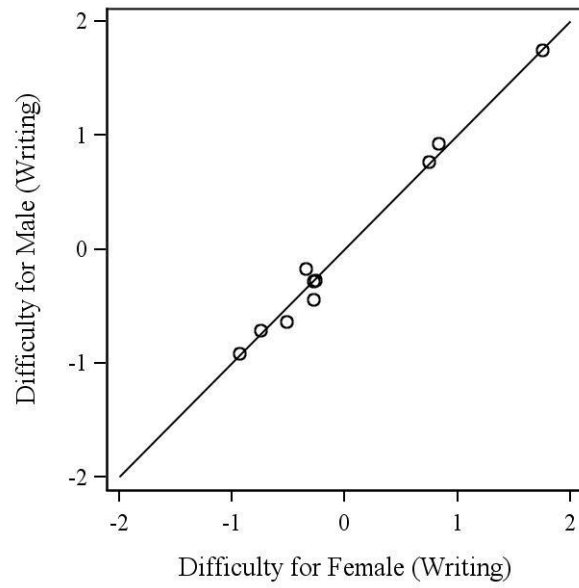

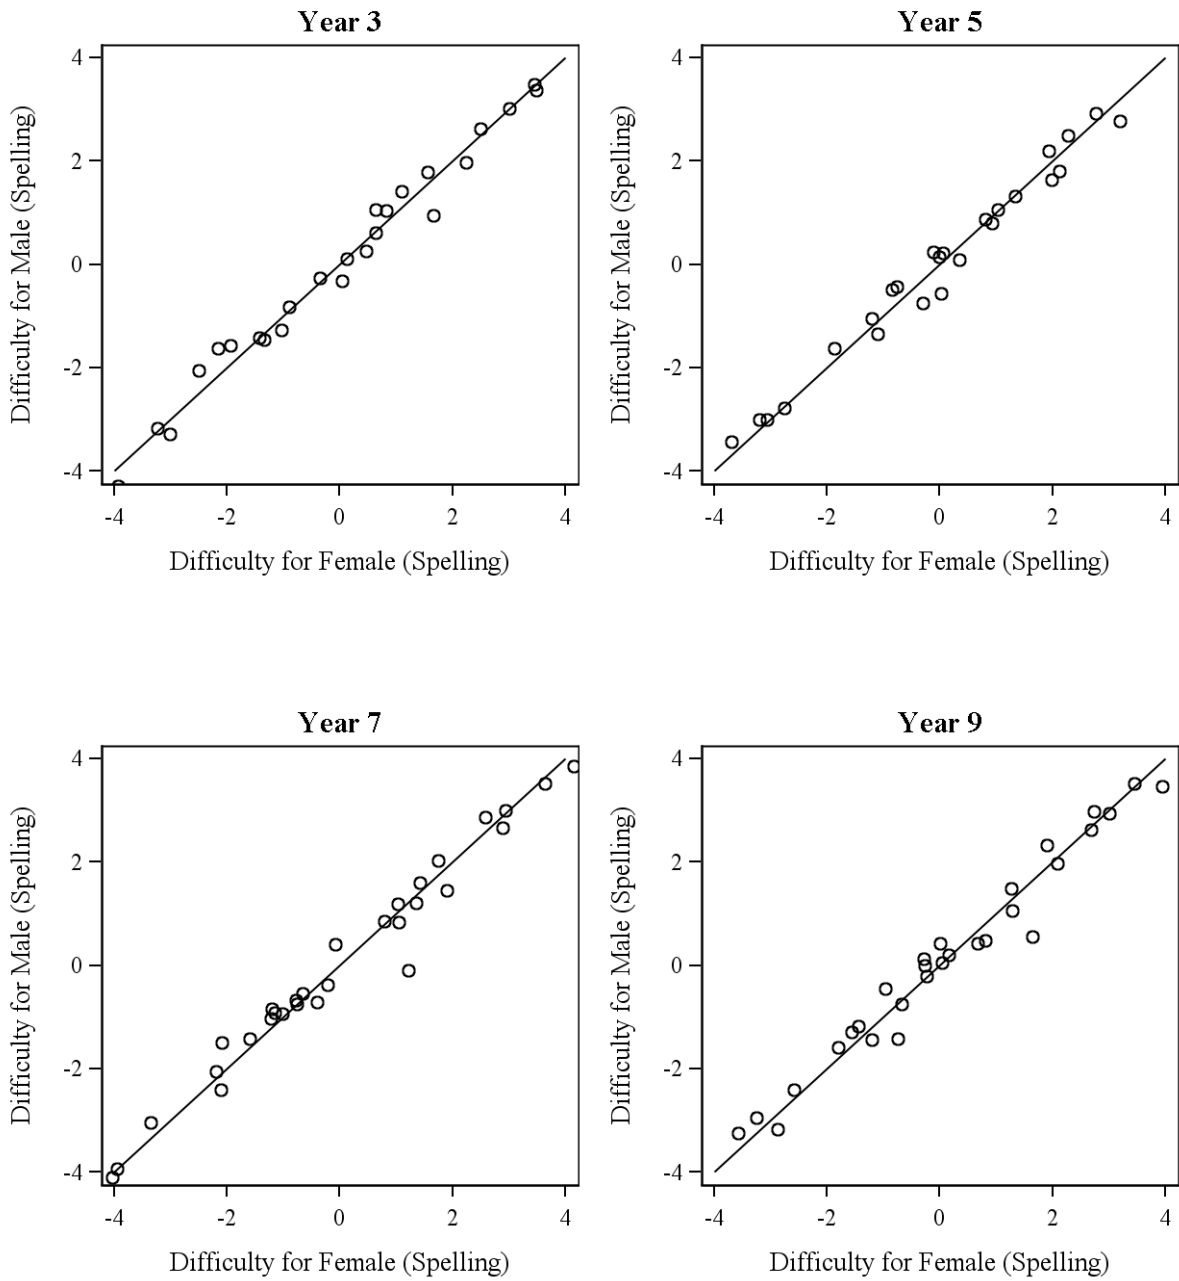

Each 'X' represents 7.7 cases

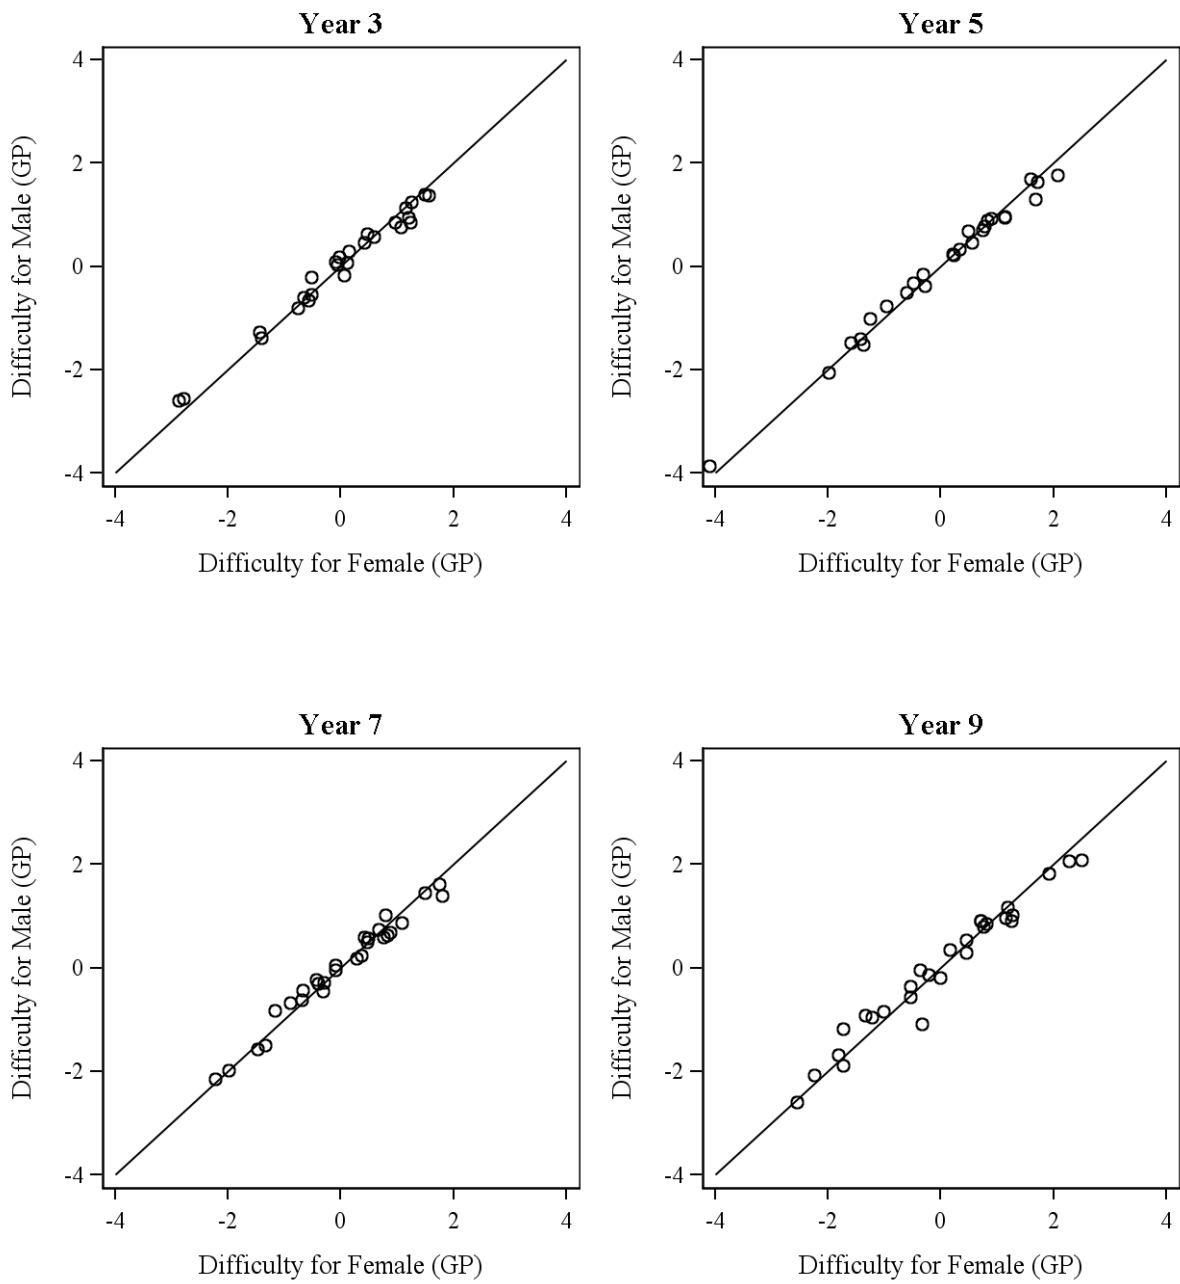

APPENDIX F. GENDER DIF ANALYSIS

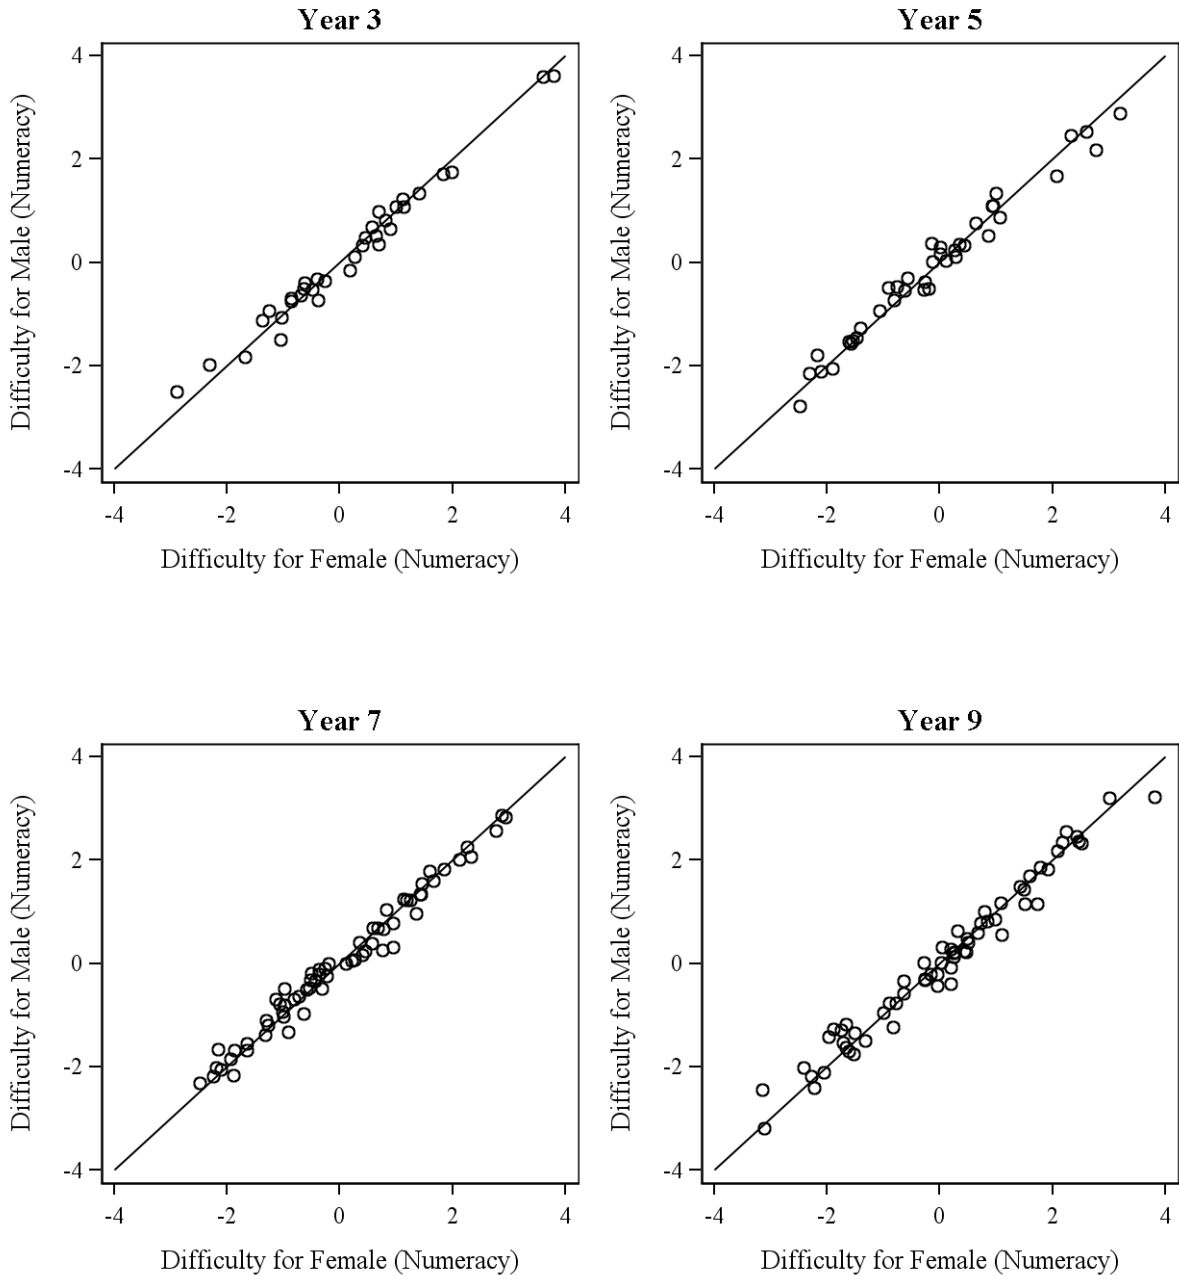

F.1 Centred Item Locations of Male and Female Students in Reading (2016)

F.2 Centred Item Locations of Male and Female Students Years 3, 5, 7, and 9 Writing (2016)
